Computer Science — Class 7

Easy Exam Notes • Unit 2 to Unit 6

UNITS IN THESE NOTES

#	Unit
2	Digital Skills
3	Computational Thinking
4	Programming
5	Digital Citizenship
6	Entrepreneurship in Digital Age

5 Units • Matched topic-by-topic against the official PCTB textbook

HOW TO READ EVERY UNIT

1 Topic notes › 2 Exercise Long Questions with full answers › 3 Short Questions › 4 MCQs with the correct answer marked › 5 Mistakes found in the book

- ✔ Every topic and sub-topic in the book is covered — checked page by page against the textbook.
- ✔ Every official Exercise Long Question, Short Question and MCQ is answered, with extra practice questions added.
- ✔ Written in short, simple sentences in easy English, so every student can read it once and remember it.

Prepared by Ali Hamza, Subject Teacher — Computer Science

Unit 2 — Digital Skills

TOPIC 1: WORD PROCESSOR

We write things by hand every day — but on a computer, we use a word processor instead. It is a program that lets us type text, change it, save it, and print it out.

Purpose of a word processor (2.1)

A word processor helps us make all kinds of documents, like a letter, a note, a report, or our homework. It does this through four main jobs:

1. **Composing:** Typing new text onto the page.
2. **Editing:** Going back to change the text — adding a word, removing one, or fixing a mistake.
3. **Saving:** Storing the document inside the computer, so we can open it again later.
4. **Printing:** Sending the document to a printer to get a paper copy.

Word processing software (2.1.1)

In short, a word processor lets us type, format, save and print text — and by "text", we simply mean words and numbers.

Microsoft Word (MS Word) is the most popular word processor. People use it to make brochures, letters, class activities, quizzes, tests and homework.

Examples of word processors: Google Docs, WordPerfect, LibreOffice Writer, Dragon, Scrivener and RagTime — even Notepad and Open Office can be used to write documents.

Open a new Word document (2.1.2)

When we open a new document, we usually start with a blank page. But we can also start from a ready-made design, called a **template**. Here's how:

1. Open Word. If it's already open, click **File > New**.
2. In the "Search for online templates" box, type a word like *letter*, *resume* or *invoice* — or just pick a category, such as Business, Personal or Education.
3. Click a template to preview it.
4. Click **Create**, and the new document opens.

Interface of MS Word (2.1.3)

The **interface** is simply the screen we see when MS Word opens. Let's go through its main parts:

1. **Title Bar:** Sits right at the top and shows the document's name, like "Document1 - Word".
2. **Quick Access Toolbar:** In the top-left corner, with buttons we use all the time, like Save, Undo and Redo.
3. **Tabs:** Named File, Home, Insert, Design, Layout, References, Mailings, Review and View — each one opens its own set of commands.
4. **Ribbon:** The wide strip below the tabs. It shows the commands for whichever tab is open, grouped under names like Clipboard, Font, Paragraph and Styles.
5. **Help Button:** Type what we want to do into the "Tell me" box, and it helps us find it.
6. **Window Controls:** The Minimize, Maximize and Close buttons, tucked in the top-right corner.
7. **Scroll Bars:** The vertical one moves the page up and down; the horizontal one moves it left and right.
8. **Zoom in / Zoom out:** Found in the bottom-right corner — it makes the page look bigger or smaller.

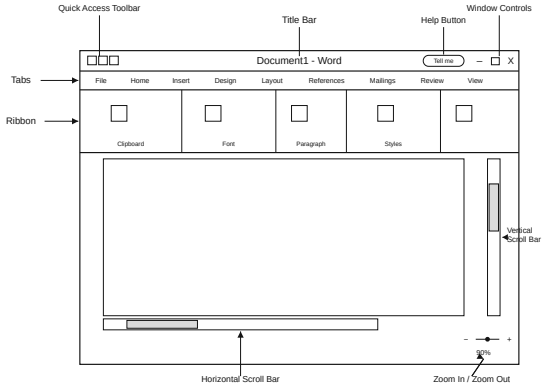

Fig: The MS Word 2016 interface — Title Bar, Quick Access Toolbar, Tabs, Ribbon, Help Button, Window Controls, Scroll Bars and Zoom

Long Question: Describe the purpose of a word processor. *[Exercise — Brief Q7]*

1. **Meaning:** A word processor is a computer program that lets us enter, format, save and print text. Microsoft Word is the most popular one.
2. **Composing:** We use it to type new text — maybe a letter, an application, or our homework.
3. **Editing:** Mistakes are easy to fix. We can add new words or delete the wrong ones, without rewriting the whole page.
4. **Formatting:** We can make text bold, italic or underlined, and change its font, size, colour or alignment.
5. **Saving:** We can save our document and open it again whenever we need to.
6. **Printing:** A printer gives us a paper copy whenever we want one.
7. **Uses:** All kinds of things — letters, brochures, quizzes, tests, reports and homework.

TOPIC 2: WORKING WITH TEXT IN MS WORD

MS Word has many tools that a simple text editor just doesn't have — we can change how text looks, add pictures, and do much more.

Adding and modifying the text (2.1.4)

The look we give to text is called **character formatting**, and it covers things like font, font size, bold, italic, underline, strikethrough, subscript, superscript, font colour and highlight colour.

1. **Font Face:** It changes the shape of the letters — like changing your handwriting style.
2. **Font Size:** Makes the text bigger or smaller.
3. **Font Colour:** Changes the colour of the text.

To format any text, we first **select** it, then use the tools on the Home tab.

There are three font styles on the Home tab:

1. **Bold (B):** Makes text look thick and dark.
2. **Italic (I):** Makes text lean (slant) to one side.
3. **Underline (U):** Draws a line under the selected text.

Save and open files (2.1.5)

Once we've written our text, we need to save the document — this lets us open and use it again later.

- **To Save:** Go to the **File** tab and click **Save**, or click the Save button on the Quick Access Toolbar. Then pick a folder and type a name for the document.
- **To Open:** Go to the **File** tab and click **Open**, then pick the saved file.

Format a document (2.1.6)

- **Text Alignment:** Alignment means where the text sits on the page. MS Word has **four** types of alignment:
  1. **Left Align** (Ctrl + L)
  2. **Center Align** (Ctrl + E)
  3. **Right Align** (Ctrl + R)
  4. **Justify** (Ctrl + J) — here, the text touches both the left margin and the right margin.

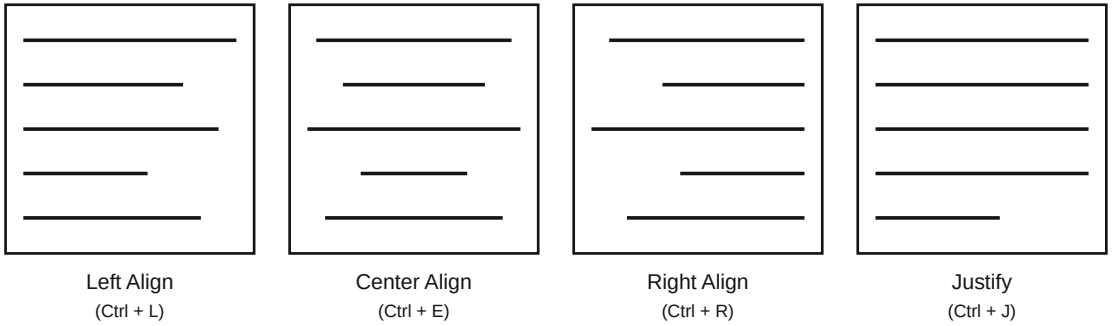

Fig: The four types of text alignment in MS Word — Left, Center, Right and Justify

- **Page Margins:** Margins are the blank spaces on the top, bottom, left and right of a page, and they make a document look neat and clean. To change them, click the **Margins** button on the **Layout** tab.
- **Page Layout:** The **Layout** tab controls how the whole document looks. We can use it to:
  - Apply themes and colour schemes.
  - Change the **orientation** — Portrait (tall page) or Landscape (wide page).
  - Change page size, margins, indentation, line spacing and paragraph settings.

Remember: Portrait orientation means the page stands up tall, while Landscape means it lies on its side, wide.

TOPIC 3: PICTURES, CUT, COPY, PASTE AND SPELL CHECK

MS Word lets us put pictures in a document, and it also lets us move text from one place to another very easily.

Insert, resize and add text in images (2.1.7)

To insert an image:

1. Put the cursor where you want the image.
2. Click the **Insert** tab.
3. Click **Pictures** in the Illustrations group.

4. Pick where the picture comes from:
   - **This Device** — a picture saved on your own computer.
   - **Stock Images** — ready-made icons, stickers and pictures.
   - **Online Pictures** — search pictures using Bing (Microsoft's search engine), which also gives a link to OneDrive.
5. Find the picture in the Insert Picture box.
6. Click **Insert**.

To resize an image: Click the image, and a border with small handles appears — drag a handle to make the image bigger or smaller.

To align an image with text: Click the image, then click **Layout Options**, and pick one: In Line with Text, Square, Tight, Through, Top and Bottom, Behind Text, or In Front of Text.

Cut, copy and paste (2.1.8)

1. **Cutting:** Removes text or an image from its place and keeps it in the **clipboard** — a temporary storage spot in the computer.
2. **Copying:** Makes a duplicate (copy) of text or an image in the clipboard, while the original stays in its place.
3. **Pasting:** Moves the text or image from the clipboard to a new place in the document.

Keyboard shortcuts:

Command	Shortcut	What it does
Cut	Ctrl + X	Removes the selected item and keeps it in the clipboard
Copy	Ctrl + C	Makes a copy of the selected item in the clipboard
Paste	Ctrl + V	Puts the item from the clipboard where the cursor is

Ribbon method: Select the text or image, go to the **Home** tab, then click Cut or Copy in the Clipboard group. This needs more steps than shortcuts, but it gives more paste choices.

Spell check (2.1.9)

Spell check is a tool built into MS Word that checks our spelling and grammar mistakes.

1. If it's turned on, Word underlines spelling and grammar mistakes automatically while we type.
2. We can also open the **Spelling & Grammar** box from the **Review** tab, which checks all mistakes at once.
3. The shortcut key for spelling and grammar check is **F7**.

TOPIC 4: LISTS, SAVE VS SAVE AS, TABLES, HEADER/FOOTER, THESAURUS AND PRINTING

These tools help us arrange our document, making it look neat and professional.

Create and modify numbered and bulleted lists (2.1.10)

1. **Numbered List:** Each item has a number or letter (1, 2, 3 or a, b, c) — we use it when items must be in a fixed order, like steps in a method.
2. **Bulleted List:** Each item has a bullet (a black dot or another symbol), but no number — we use it when the order of items doesn't matter.

Both lists make steps and points simple and easy to read. A bullet is usually a black circle, though it can also be any other symbol.

To create a bulleted list:

1. Click the **Bullets** button.
2. Type the first item and press **Enter**.
3. The next line gets a new bullet automatically.
4. Type the next item and press Enter.
5. When the list is done, press **Enter twice** to stop the list.

To create a numbered list:

1. Click the **Numbering** button.
2. Type the first item and press **Enter**.
3. The next line gets the next number automatically.
4. Type the next item and press Enter.
5. When the list is done, press **Enter twice** to stop the list.

Difference between Save and Save As (2.1.11)

1. **Save:** Stores your new work back into the same file and folder, updating the last saved version with your new work. It's used when you do **not** want to change the name or place of the document.
   - **Shortcut:** Ctrl + S (also Shift + F12 or Alt + Shift + F2).
2. **Save As:** Used the first time we save a file, and also when we want to change the file's name, place or **format** — it helps keep the original file safe as a backup.
   - **Shortcut:** F12 (or Alt + F + A).

Save vs Save As

Save	Save As
Stores the data back in the same file and folder	Stores a new file, or the file in a new place
Prevents data loss and keeps the file updated with the latest work	Saves an existing file in a new place, with the same or a different name
Works on the current file	Can create a new file
Has only one step	Needs some extra steps
Does not let us save in another file format	Lets us change the file format

Insert and format a table (2.1.12)

1. Place the cursor where you want the table.
2. Click the **Insert** tab.
3. Click **Table** in the Tables group.
4. Move the pointer across and down the grid, and pick how many rows and columns you want.
5. The selected cells turn orange — click the selected part, or press **Enter**, to put in the table.

Header, footer and page numbers (2.1.13)

Headers and footers add extra information, like the title, file name, date and page numbers, so a document looks neat and easy to read.

1. **Header:** Appears in the top margin of every page.
2. **Footer:** Appears in the bottom margin of every page.

Steps: Open the document, click the **Insert** tab, then click Header, Footer or Page Number in the Header & Footer group.

Long Question: Elaborate on the use of thesaurus and synonyms features in Microsoft Word. *[Exercise — Brief Q5]*

1. **Thesaurus:** The thesaurus is a tool in MS Word (2.1.14) that finds **synonyms** (words with the same meaning) and **antonyms** (words with the opposite meaning) for a word we choose.
2. **Use:** We mostly use it when writing an email, a letter, a project report or a research paper — it helps us pick a better word, and stops us from using the same word again and again.
3. **Steps to use synonyms:**

✦

- Open a new Word document, or an existing one.
- Type a word, or find a word already in the document.
- Select (highlight) the word — a blue background appears behind it.
- Right-click on the word, and a menu appears.
- Move the cursor to **Synonyms**, then click the best word from the list.

4. We can also open the full Thesaurus box from the Synonyms menu, or from the **Review** tab.

Apply a procedure to print a document (2.1.15)

We can print a document easily, as long as a printer is joined to the computer and its software is installed.

1. Open the Word document — double-click it, or go to **File > Open**.
2. Go to **File > Print**.
3. Choose the print options — number of copies, printer, pages — then click **Print** or **OK**.

TOPIC 5: MULTIMEDIA PRESENTATION (POWERPOINT)

Create a multimedia presentation (2.2)

A **multimedia presentation** is a set of media objects — these can be pictures, text, video clips and sound, shown one after another on slides, at a fixed time and a fixed place on the screen.

The easiest way to make a multimedia presentation is **Microsoft PowerPoint**, where we can add video, sound and animation. Its biggest advantage is that anyone can edit the presentation easily.

Adding new slides (2.2.1)

1. On the **Home** tab, click **New Slide**.
2. In the New Slide box, pick the layout you want — for example, Title Slide, Title and Content, Section Header.
3. Click **Add Slide**.

Adding various objects on the slides (2.2.2)

PowerPoint gives us many ways to add clip art, images, audio and graphics, and we can bring in files saved in different formats. It also has its own gallery of clip art pictures.

To insert clip art: Choose a slide layout that has a content box (placeholder), then click the **Insert Clip Art** button inside it.

To insert an object:

1. Click on the slide where you want to place the object.
2. On the **Insert** tab, in the Text group, click **Object**.
3. If the object doesn't exist yet, click **Create New**.
4. To show the content on the slide, clear (untick) the **Display as icon** check box.

Adding notes (2.2.3)

Speaker notes help the speaker remember and stress the main points during a talk — the audience does **not** see these notes.

1. Open the presentation, then click **View > Notes**, or click the **Notes** button at the bottom of PowerPoint.
2. Click "Click to add notes" and type your notes for that slide — there's no limit to how many you can add.

Creating a slide show and an executable file (2.2.4)

Once all slides are ready, press **F5** to start the show from the first slide, and use the arrow keys to move between slides.

To set up the slide show: Go to **Slide Show > Set Up Slide Show** and pick one option:

1. **Browsed by an individual (window):** The show runs inside a window — this works best when you save the show on a CD.
2. **Browsed at a kiosk (full screen):** The show runs by itself on the full screen — this works best when you turn the show into a video.

Add timings to each slide: Go to **Slide Show > Rehearse Timings**, and the show opens in full screen with a Recording toolbar and a timer.

- **Next:** go to the next slide.
- **Pause:** stop the timer.
- **Repeat:** record the time again for that slide.

At the end, close the toolbar and click **Yes** to keep the timings.

Edit timings of a slide: Go to **View > Slide Sorter**, click **Transitions**, pick a slide, then type the time in the **Advance Slide After** box and press **Enter**.

Explain the importance of a presentation tool (2.2.5)

Long Question: Write a note on the benefits of Microsoft PowerPoint, which add importance to a presentation for any kind of user. *[Exercise — Brief Q1]*

Microsoft PowerPoint is one of the most popular presentation tools, used by people of all ages. It helps us show our ideas in an attractive way, and in business meetings, it makes the session more interesting than the old way of talking.

Its main benefits are:

1. **Point to Point Focus:** The presentation stays focused on the main points — we use short points with pictures, sound or animation, instead of long paragraphs, which saves time and effort.
2. **Attractive Visuals:** Pictures stay in our mind longer than spoken words, so colourful backgrounds, text and animation give the slides a striking look.
3. **Numerous Resources:** PowerPoint has many features, and we can add material and references from the Internet with a single click.
4. **Breaking the Complexity:** It helps the presenter explain hard ideas in a simple way. The presenter can use a laser pointer, keeping eye contact with the audience while pointing at the bullet points.
5. **User Ownership:** We can add a digital signature, so nobody can change the presentation without the owner's permission.
6. **Multimedia Capability:** A presentation can be turned into a video or audio file — we can share it on the Internet, save it on a DVD, or even view it on mobile phones and other devices.
7. **Easy to Access:** We can send slides by email easily, or share them on storage devices, like a USB drive.

Long Question: Prepare a presentation on the book the students read last time, using all the tools. *[Exercise — Detail Q1]*

We can make a presentation in Microsoft PowerPoint with these steps:

1. **Open PowerPoint:** Open Microsoft PowerPoint and choose a Blank Presentation.
2. **Title Slide:** On the first slide, type the name of the book and your own name.
3. **Add New Slides:** Click **Home > New Slide**, pick a layout like Title and Content, and add slides for the author, the story, the main characters and the lesson of the book.
4. **Add Text:** Click inside the placeholder and type short points about the book.
5. **Add Pictures, Audio and Video:** Click the **Insert** tab, and use Pictures, Audio or Video to add the book cover or other media.
6. **Add Speaker Notes:** Click **View > Notes**, and write what you will say for each slide.
7. **Add Timings:** Use **Slide Show > Rehearse Timings** to set a time for each slide.
8. **Start the Slide Show:** Press **F5** to show the presentation from the first slide, using arrow keys to move between slides.
9. **Save:** Press **Ctrl + S** to save the presentation — we can also save it as a video to share with others.

TOPIC 6: ELECTRONIC MAIL (E-MAIL)

Electronic mail, or **email**, is a way to communicate — it uses electronic devices to send messages across networks.

About email (2.3)

Gmail (Google mail) works like an email client. It connects to the Gmail server, and also to other mail servers using the **POP3** or **IMAP** protocol (a protocol is a set of rules). Gmail shows the mailbox in many panes (parts), so we can read mail easily, and it also has a junk mail filter that blocks unwanted mail.

Create an electronic mail — things we need (2.3.1)

To send an email, we need:

1. An email address.
2. A password.
3. The email address of the person we want to send the email to.
4. An Internet connection.

Important terms

1. **Email Address:** The one-of-a-kind address of an email account, where we send and receive mail. Example: `testclass7@gmail.com` — it has a user name, the @ sign, and the domain name.
2. **Password:** A secret word made of letters, numbers and symbols that protects our account so no one else can open it.
3. **Recipient:** The person who receives the email — their address goes in the To, Cc or Bcc box.
4. **Attachment:** A computer file that is sent along with an email message.
5. **Contacts:** A saved list of names and email addresses of people we talk to.

Types of emails we should remove from a contact list

Type	Meaning
Bounced	An email that cannot be delivered, or has a delivery problem
Malformed	An email address in the wrong format; it does not meet the rules

Type	Meaning
Fake	A fake address made by a fake email generator
Inactive	An address that gets newsletters but the owner never reads them
Service	An address like `support@company.com` or `team@company.com`
Unsubscribed	An address whose owner has refused to get our messages
Duplicate	An email address written in the list more than once
Spam Trap	An address made on purpose to catch spammers

Use an email service to create an email account (2.3.2)

1. Click the **Compose** button in the left panel.
2. Enter the recipient's address.
   - **To:** Has the address of the main (primary) recipient.
   - **Cc (Carbon Copy):** Sends a copy of the email to another (secondary) address — everyone can see who got a Cc.
   - **Bcc (Blind Carbon Copy):** Sends a hidden copy to someone; the other recipients don't know about it.
   - If the recipient is in your Address Book, click To, Cc or Bcc to open the Select Names box.
   - To send an email to more than one person, put a **semicolon (;)** between the addresses.
3. Type the subject in the Subject line.
4. Type your message in the body of the email.
5. Click **Send**.

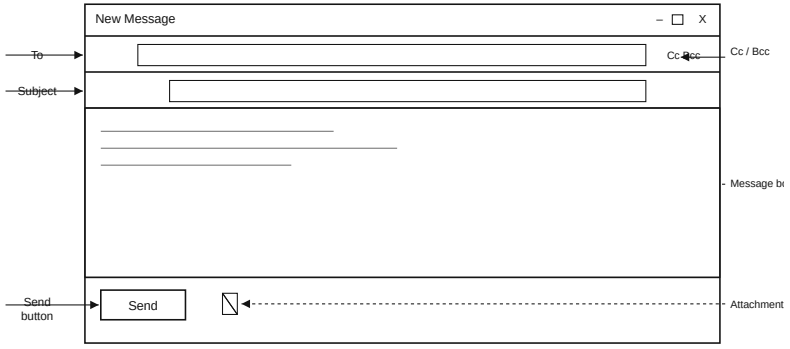

Fig: Parts of a new email message window — To, Cc/Bcc, Subject, message body, attachment and Send button

Send and receive emails with attachments (2.3.3)

An **attachment** is a computer file sent inside an email message. We usually see it in the Reading Pane, under the subject, or in the message body — double-click the attachment icon to open it.

Files we can attach:

File type	Full name
bmp	Bitmap Image File
gif	Graphical Interchange Format File
jpg / jpeg	JPEG Image
pdf	Portable Document Format File
doc / docx	Microsoft Word Document
xls / xlsx	Microsoft Excel Spreadsheet
csv	Comma-Separated Values
zip	Data Compression File

Good habits for writing an email

The tone and language of an email should be polite, clear and correct.

1. Use a clear, professional subject line.
2. Proofread (check) every email before you send it.
3. Write the email first, then type the recipient's address.
4. Double-check that you have the correct recipient.
5. Make sure you Cc everyone who needs it.
6. You don't always have to click "Reply all".
7. Reply to your emails.
8. Add a signature block at the end.
9. Use the right level of formality — formal or informal.
10. Keep emails short and to the point.

Organize emails using folders and labels (2.3.4)

Folders help us arrange email messages, calendars, contacts and tasks — in Gmail, folders are called **labels**.

To add a folder: In the left pane, right-click where you want the folder, then click **New Folder** — a new folder is made, and we can rename it.

Log in to an email inbox (2.3.5)

1. Go to the `mail.google.com` page.
2. Click the Gmail **Sign in** option.
3. Enter the email address and click **Next**.
4. Enter the password and click **Next**.

An appropriate use of email — signing out (2.3.6)

Long Question: Write the proper way of signing out of an email account when not using it. *[Exercise — Brief Q4]*

1. **Right use:** After we use email, we should always sign out (log out) of our account — this is very important on a computer that is not our own, such as a school lab or a cafe computer.
2. **Reason:** If we don't sign out, another person can open our account, read our emails, or send wrong emails in our name.

3. **Steps to sign out of Gmail:**

✦

- Click the user name (profile picture) at the top of the Gmail page — a menu of options appears.
- From these options, click **Sign out**.

4. **Other good habits:** Never share your password, and don't let the browser save your password on a shared computer.

TOPIC 7: EMAIL AUTHENTICATION, USES, PLATFORMS AND PROTOCOLS

Use email as a means of authentication for another website login (2.3.7)

Long Question: State the different ways in which we can use email as a means of authentication for another website. *[Exercise — Brief Q2]*

Many websites use our email address to check who we are. When we make an account, or log in, on another website, it sends a link or a code to our email — this proves the email is really ours.

Three common authentication types:

1. **Password-based Authentication:** The user enters an email address and a password — this is the most common method.
2. **Certificate-based Authentication:** A digital certificate (a kind of digital ID card) identifies a user or a device.
3. **Biometric Authentication:** Uses body features, like a fingerprint or a face.

(The book's summary also names two more types: **Multi-factor authentication**, where more than one check is used — like a password plus a code — and **Token-based authentication**.)

Three major methods used in email authentication — all of them are based on DNS TXT records:

1. **DKIM (DomainKeys Identified Mail):** The sending mail server adds a secret signature to the email with a **private key**, and the receiving server checks this signature with a **public key** kept in the DNS.
2. **SPF (Sender Policy Framework):** The receiving mail server checks the DNS to see if the sender is allowed to send emails — then the email goes to the inbox, or the junk folder, or it's quarantined (held back) or blocked.
3. **DMARC (Domain-based Message Authentication, Reporting and Conformance):** Uses both SPF and DKIM. If the email passes, it goes to the inbox; if it fails, it's rejected (dropped), or sent to the spam folder (quarantine) — a report is sent back to the sender.

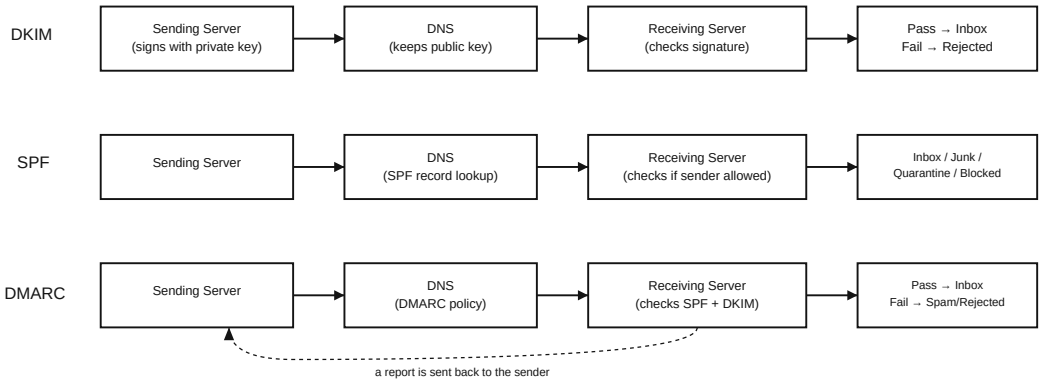

Fig: How DKIM, SPF and DMARC authenticate an email

Uses of electronic mail (2.3.8)

Long Question: Discuss the importance and uses of email. *[Exercise — Brief Q3]*

Importance: Today, people want things to be fast, and want to save time. Email is quick, cheap and easy — this is why it's used and recommended as a way to communicate all around the world.

Uses of email:

1. We can talk to people all over the world for free.
2. We can contact more than one person at a time with group mails.
3. We can keep a record of our documents and talks (conversations).
4. We can work together with others (collaboration).
5. We can send files as attachments.
6. We can keep one conversation going for many people together.
7. We can make calendars and set appointments.

The common platforms for electronic mail (2.3.9)

Long Question: Identify and explain the common platforms for electronic mail. *[Exercise — Brief Q8]*

An **email platform** is a website or service that gives us an email account. Some common platforms are:

1. **Gmail:** The free email service from Google, and the most used platform.
2. **Microsoft Outlook:** The email service from Microsoft (Outlook.com).
3. **Yahoo Mail:** The free email service from Yahoo.
4. **AOL Mail (AOL.com):** An old and well-known free email service.
5. **Zoho Mail:** An email service mostly used by businesses.
6. **ProtonMail:** An email service known for strong security and privacy.

With these platforms, we can send, receive and organise emails from any computer or phone with an Internet connection.

Create an e-mail address, and how to send electronic mail (2.3.10)

Long Question: Create an email address using common, freely available platforms like Microsoft or Google. *[Exercise — Detail Q2]*

With a free Gmail account, we can use our email, calendar, tasks and contacts from anywhere with an Internet connection.

Steps to create a Gmail account:

1. Open a web browser, go to the `gmail.com` sign-up screen, and click **Create account**.
2. Choose “For myself” — a new window opens.
3. Enter your first name, last name and a user name.
4. Enter a password and confirm it, then press **Next** (use 8 or more characters, with a mix of letters, numbers and symbols).
5. Enter a phone number and a recovery email address — these are optional (not compulsory).
6. Enter your birthday.
7. Choose your gender from the drop-down list and click **Next**.
8. Read the privacy policy and terms, then click **“I agree”**.
9. Gmail sets up your account and shows a welcome screen — you can now use the account on computers and mobile phones.

Process of authentication (2.3.11)

Email authentication is a technical way to check that an email is not forged (fake) — it proves the email really comes from the person it claims to be from. We mostly use it to stop harmful and fraud emails, such as spam.

Email protocols (2.3.12)

Long Question: Explain the standard protocols SMTP and POP3. *[Exercise — Brief Q10]*

An **email protocol** is a set of rules that makes sure emails can move between different servers and email programs (clients) in a standard way — this is why email works the same for every user, everywhere.

The common protocols are:

1. **POP (Post Office Protocol):** Email clients (programs) use POP to download emails from the server. It’s mostly a one-way protocol, and does **not** sync (copy) changes back to the server. **POP3** is its version 3.
2. **IMAP (Internet Message Access Protocol):** The standard protocol for incoming email. It keeps emails on the mail server, so the user can see and manage them as if they were saved on their own device, and changes stay the same on every device.
3. **SMTP (Simple Mail Transfer Protocol):** The main protocol for **sending** email — it moves emails between email clients and email servers.

In short: SMTP sends the email, while POP3 or IMAP brings the email to the receiver.

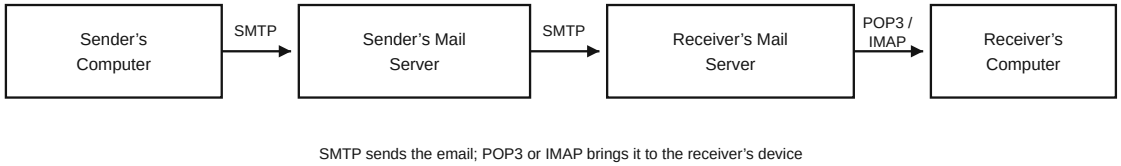

Fig: How SMTP, POP3 and IMAP move an email from sender to receiver

SHORT QUESTIONS — UNIT 2

1. **Describe the purpose of a word processor.** *[Topic 1 · Exercise]*
   A word processor is used to type, edit, format, save and print text. It helps us make letters, reports, tests and homework.
2. **Write the four functions of a word processor.** *[Topic 1 · Book concept]*
   The four functions are composing, editing, saving and printing.
3. **Give any four examples of word processors.** *[Topic 1 · Book concept]*
   MS Word, Google Docs, WordPerfect and LibreOffice Writer.
4. **Write a note on the benefits of Microsoft PowerPoint.** *[Topic 5 · Exercise]*
   PowerPoint keeps a talk focused on the main points. It gives attractive visuals. It adds resources from the Internet. It explains hard ideas simply. It allows a digital signature. It can be turned into a video. It is easy to share by email.
5. **State the ways we can use email for authentication on another website.** *[Topic 7 · Exercise]*
   Websites send a link or a code to our email to prove who we are. Common types are password-based, certificate-based and biometric authentication. Email itself is checked with DKIM, SPF and DMARC.
6. **Discuss the importance and uses of email.** *[Topic 7 · Exercise]*
   Email is fast, cheap and easy. We use it to talk to people all over the world for free. We can send group mails, send attachments, work together, and make calendars and appointments.
7. **Write the proper protocol for signing out of an email account.** *[Topic 6 · Exercise]*
   Click the user name at the top of the Gmail page. Then click Sign out. We should always sign out on a computer that is not our own.
8. **Elaborate on the use of thesaurus and synonyms in MS Word.** *[Topic 4 · Exercise]*
   The thesaurus finds synonyms (same meaning) and antonyms (opposite meaning) for a word. Select the word, right-click, go to Synonyms, and click the best word.
9. **Differentiate between Save and Save As.** *[Topic 4 · Exercise]*
   Save updates the same file with your new work (Ctrl + S). Save As saves the file for the first time, or with a new name, place or format (F12).
10. **Identify the common platforms for electronic mail.** *[Topic 7 · Exercise]*
    Gmail, Microsoft Outlook, Yahoo Mail, AOL Mail, Zoho Mail and ProtonMail.
11. **Define recipient.** *[Topic 6 · Exercise]*
    The person who receives an email is called the recipient.
12. **Define attachment.** *[Topic 6 · Exercise]*
    A computer file that is sent along with an email message is called an attachment.

13. **Define password.** *[Topic 6 · Exercise]*
A password is a secret word of letters, numbers and symbols that protects our account.

14. **Define email address.** *[Topic 6 · Exercise]*
It is the one-of-a-kind address of an email account, where emails are sent and received, such as testclass7@gmail.com.

15. **Explain the standard protocols SMTP and POP3.** *[Topic 7 · Exercise]*
SMTP (Simple Mail Transfer Protocol) sends emails between clients and servers. POP3 (Post Office Protocol) downloads emails from the server to the user's device.

16. **What is the difference between POP3 and IMAP?** *[Topic 7 · Book concept]*
POP3 downloads emails and does not sync back to the server. IMAP keeps emails on the server, so they look the same on every device.

17. **What is the difference between Cc and Bcc?** *[Topic 6 · Book concept]*
Cc sends a copy that all recipients can see. Bcc sends a hidden copy that other recipients do not know about.

18. **What is a multimedia presentation?** *[Topic 5 · Book concept]*
It is a set of media objects, such as text, pictures, video and sound, shown on slides. The easiest way to make it is MS PowerPoint.

19. **What are speaker notes?** *[Topic 5 · Book concept]*
Speaker notes are notes added to a slide to help the presenter remember the main points. The audience does not see them.

MULTIPLE CHOICE QUESTIONS — UNIT 2

These are the book's own Exercise MCQs plus a few extra practice MCQs, with the correct answer marked ✔ above the option.

1. To open a word document, we go to the ____ tab. *[Topic 1 · Exercise MCQ 1]*

a) Open	**b) File** ✔	c) Home	d) Insert

2. ____ is a word processor that allows us to enter, format, save and print text. *[Topic 1 · Exercise MCQ 2]*

a) MS Excel	b) MS PowerPoint	**c) MS Word** ✔	d) MS Paint

3. We can format the text from the ____ tab. *[Topic 2 · Exercise MCQ 3]*

a) File	b) Format	c) Insert	**d) Home** ✔

4. ____ makes text appear thicker and darker. *[Topic 2 · Exercise MCQ 4]*

a) Italics	b) Format	c) Font face	**d) Bold** ✔

5. There are ____ types of alignment in text formatting in Word. *[Topic 2 · Exercise MCQ 5]*

a) 3	**b) 4** ✔	c) 5	d) 6

6. The ____ tab lets you control the look and feel of your document in MS Word. *[Topic 2 · Exercise MCQ 6]*

a) Layout ✔	b) Margin	c) Caption	d) Format

7. We can insert an image in the Word document from the ____ tab. *[Topic 3 · Exercise MCQ 7]*

a) Insert ✔	b) File	c) Home	d) View

8. We can resize an image by clicking and dragging on its ____. *[Topic 3 · Exercise MCQ 8]*

a) Outline	b) Center	**c) Resize handles** ✔	d) Arrows

9. The keyboard shortcut to copy is ____. *[Topic 3 · Exercise MCQ 9]*

a) Ctrl + X	**b) Ctrl + C** ✔	c) Ctrl + P	d) Ctrl + S

10. We can insert a table in the Word document from the ____ tab. *[Topic 4 · Exercise MCQ 10]*

a) File	b) Home	**c) Insert** ✔	d) View

11. ____ appears at the top margin of the Word document. *[Topic 4 · Exercise MCQ 11]*

a) Footer	b) Title	c) Address bar	**d) Header** ✔

12. To print the Word document, we go to the ____ tab. *[Topic 4 · Exercise MCQ 12]*

a) Print	**b) File** ✔	c) Format	d) Insert

13. The easiest way to create a multimedia presentation is on ____. *[Topic 5 · Exercise MCQ 13]*

a) Microsoft Word	b) Microsoft Excel	**c) Microsoft PowerPoint** ✔	d) Microsoft Paint

14. The keyboard shortcut to create a new email is ____. *[Topic 6 · Exercise MCQ 14]*

a) Ctrl + S	b) Ctrl + N	**c) Ctrl + M** ✔	d) Ctrl + X

15. It is always safe to ____ your account, if you are not using it. *[Topic 6 · Exercise MCQ 15]*

a) Protect	**b) Sign out** ✔	c) Sign in	d) Delete

16. How many primary functions does a word processor have? *[Topic 1]*

a) two	b) three	**c) four** ✔	d) five

17. The keyboard shortcut to cut is: *[Topic 3]*

a) Ctrl + C	**b) Ctrl + X** ✔	c) Ctrl + V	d) Ctrl + Z

18. The keyboard shortcut to paste is: *[Topic 3]*

a) Ctrl + P	b) Ctrl + C	**c) Ctrl + V** ✔	d) Ctrl + X

19. Cut or copied text is kept in the: *[Topic 3]*

a) Recycle Bin	**b) Clipboard** ✔	c) Ribbon	d) Title Bar

Mistakes Found in the Book

1. **Alignment count (page 20, Exercise MCQ 5):** The book's own answer key gives (a) 3 as the correct answer. But the book's own body text, on page 20, clearly shows and names **four** types of alignment: Left Align, Center Align, Right Align and Justify. So the correct answer should really be (b) 4. These notes use the book's own body text and mark (b) 4 as correct.
2. **New email shortcut key (Exercise MCQ 14, and the Summary on page 38):** The official answer key says the answer is (c) Ctrl + M. But the book's own **Summary** box, at the very end of the unit, clearly states: *"Click the New Email button on the Home tab of Mail. Press Ctrl + N."* This is the book contradicting itself — one part says Ctrl + N, the answer key says Ctrl + M. In real Microsoft Outlook, a new email is made with Ctrl + N (or Ctrl + Shift + M). Since this is a graded exam answer, these notes tick (c) Ctrl + M, to match the official answer key — but students should know the book itself disagrees with its own key.
3. **Number of authentication types (page 34 vs page 39):** Page 34 (section 2.3.7) says there are **3** common authentication types: password-based, certificate-based and biometric. But the Summary on page 39 lists **5** types: it adds multi-factor authentication and token-based authentication. These notes give the 3 main types in full, and mention the other 2 so nothing is missed.
4. **Wrong app name in a heading (page 33, section 2.3.5):** The heading says "Log in an email inbox," and the paragraph below it talks about signing in to **Outlook**. But every step given is actually for **Gmail** (`mail.google.com`, Gmail Sign in). The book mixed up Outlook and Gmail instructions.

5. **Typo in the uses of email list (page 35, section 2.3.8):** The book's list of email uses has the line "**rating** calendars and appointments." This is clearly a typo for "**creating** calendars and appointments," since that is what makes sense with the rest of the sentence.
6. **"Compose email using Word" (page 30, section 2.3):** The book's intro to email says, "You can use Word to compose email." This line does not really fit with Gmail (which the rest of the section is about) — Gmail is used through a web browser, not through Microsoft Word. This sentence looks like it was copied from different source material without being updated.
7. **Heading promises something the text never explains (page 28, section 2.2.4):** The heading is "Creating a SlideShow **and an executable file**." But nowhere in this section does the book explain how to actually turn a presentation into an executable (.exe) file. It only explains how to start a slide show (F5) and set slide timings. Students should know that the book does not actually teach "executable file" creation, even though the heading mentions it.

Unit 3 — Computational Thinking

TOPIC 1: COMPUTATIONAL THINKING

What is Computational Thinking? (3.1)

Computational Thinking (CT) is simply a set of skills we use to solve problems. Here's what it helps us do:

- Take a hard (complex) problem and understand it well.
- Then come up with possible solutions for it.
- And show these solutions in a way that a computer, a human, or both can understand.

Venn diagram (Fig. 3.1): The book shows three overlapping circles. "Computing" is the big circle, and inside it sit two smaller ones — "Computational Thinking" and "Computer Science" — which overlap each other too. This shows that computational thinking and computer science are both parts of computing.

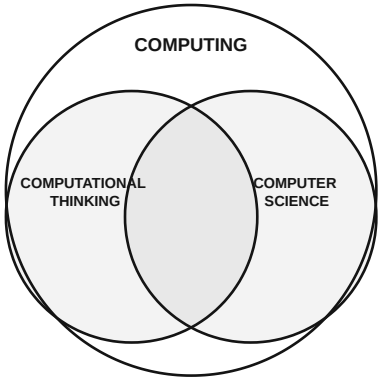

Fig: Venn diagram of Computational Thinking — Computing is the big circle, with Computational Thinking and Computer Science as two overlapping circles inside it

Cornerstones (Main Techniques) of Computational Thinking

Computational thinking rests on four key techniques:

1. **Decomposition:** Breaking a task or problem into small steps or parts.
2. **Pattern Recognition:** Finding things that are similar between problems.
3. **Generalization and Abstraction:** Finding the main rules (principles) that cause these patterns.
4. **Algorithm Design:** Making step-by-step instructions that solve the problem — and that we can reuse for similar problems too.

Extra Bit: Interdisciplinary studies means joining two or more subjects into one activity.

Decomposition

Decomposition means breaking a big, hard problem into smaller parts — because smaller parts are easier to manage, and small problems are easier to solve. In fact, decomposition is an important life skill.

Example: Say we want to host a holiday dinner — we can break this task into small parts:

- Select the menu.

- Get help from others in the kitchen.
- Tell people what to bring.
- Decide how each dish will be cooked.
- Set the time for the event.

Diagram: The book shows this as a tree. At the top sits “Big Problem”, which splits into two “Smaller Problem” boxes — and each of those splits again into small parts. This shows how one big problem breaks down into many small, easy parts.

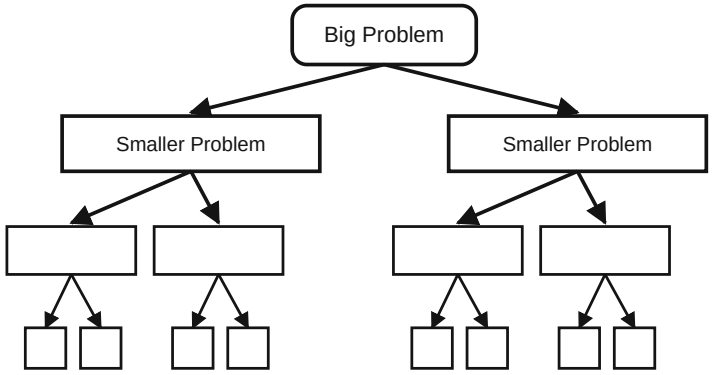

Fig: Decomposition tree — a Big Problem splits into Smaller Problems, which split further into Small Parts

Pattern Recognition

Pattern recognition means looking for patterns in a problem — and a pattern is simply something that repeats or looks similar. So we check whether a problem or solution we’ve seen before can be used again here, which may also mean noticing similar shapes, sounds, or pictures.

Example: Say we’re making a computer game — we look for similar objects, patterns, and actions in it. Finding these similarities lets us use the same method, or a slightly changed one, for all of them, which makes our solution faster and better. We call this being “more efficient”.

Do you know? Patterns are, in a way, the laws of nature and life — we can find them in every subject of life.

Generalization and Abstraction

1. **Abstraction:** Helps us pick out the details that matter for solving the problem, while ignoring the ones that don’t.
2. **Generalization:** Helps us form a general (common) idea about the problem and its solution — once we find patterns, we write them in their simplest form, so we can reuse them whenever we need to.

Example (Vehicle diagram): The book shows “Vehicle” at the top, with “Wheeled Vehicle” below it — and under that sit a car and a bicycle. A boat appears next to “Vehicle” but outside “Wheeled Vehicle”, since a boat has no wheels. So a car and a bicycle are both wheeled vehicles, while a boat and a wheeled vehicle are both just “vehicles”. We ignore small details like colour and size, and keep only the main idea.

Long Question: Define pattern recognition in your words. [Exercise, Detailed Q1]

1. **Meaning:** Pattern recognition means looking for patterns, or similar things, in a problem.
2. **What we check:** We check whether a problem or solution we solved before can be used again here — this can also mean noticing similar shapes, sounds, or pictures.
3. **Use:** We use it to find similarities between the small problems we get after decomposition.

4. **Example:** Say we're building a computer game — we find similar objects, patterns, and actions in it, then use the same method, or a slightly changed one, for all of them. This makes our solution faster and better.

TOPIC 2: ALGORITHMS

Algorithm Design

An algorithm is a set of instructions that solves a problem or completes a task. In simple words, it's just a list of steps that a human or a computer can follow to finish a task — giving the answer to a question, or the solution to a problem, in a limited (finite) number of steps.

Characteristics of an Algorithm

1. **Clear and Unambiguous:** Every step must be clear, with only one possible meaning.
2. **Well-Defined Inputs:** The inputs of the algorithm must be clearly stated.
3. **Well-Defined Outputs:** The algorithm must clearly say what the output will be.
4. **Finite-ness:** The algorithm must end (stop) after a limited time.
5. **Feasible:** The algorithm must be simple and practical — something we can actually do with the resources we have.
6. **Language Independent:** The algorithm must not depend on any one programming language.

Diagram (Fig. 3.1): The book shows a circle in the middle labelled "Characteristics of an Algorithm", with six boxes joined to it by arrows: Well-Defined Inputs, Well-Defined Outputs, Clear and Unambiguous, Finite-ness, Language Independent, and Feasible.

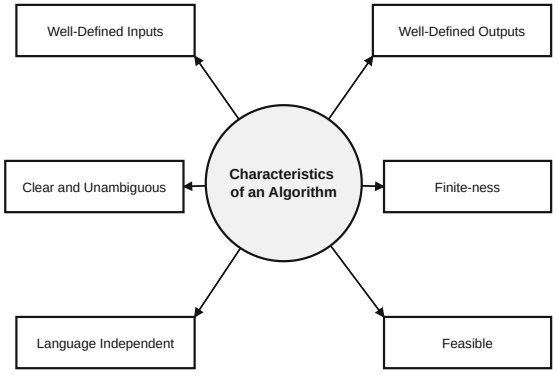

Fig: Characteristics of an algorithm — six characteristics joined to the central idea by arrows

Types of Algorithms

1. **Brute Force Algorithm:** The simplest method — it tries every possible solution, one by one, until it finds the right one.
2. **Recursive Algorithm:** The problem is broken into smaller sub-parts, and the same procedure (method) is called again and again to solve them.
3. **Searching Algorithm:** We use this to search for one item, or a group of items, inside given data.
4. **Sorting Algorithm:** We use this to arrange a group of data in a certain order — for example, from smallest to largest.

5. **Divide and Conquer Algorithm:** This breaks a problem into sub-problems, solves one of them, then joins (merges) the solutions together to get the final answer.
6. **Randomized Algorithm:** This uses a random number to give a quick (immediate) benefit, which helps decide the expected result.

Structures of an Algorithm

1. **Sequence Structure:** The steps are carried out in the exact order they are written.
2. **Selection (Conditional) Structure:** A step, or a group of steps, is carried out only if a condition is true — if not, the "else" part is carried out instead. **Example:** We use an "if-then-else" condition to check if a number is even or odd.
3. **Repetition (Loop) Structure:** A loop is a group of instructions carried out again and again, as long as a condition stays true. Once the condition becomes false, the loop stops, and the steps after it are carried out.

Types of Loops

1. **Finite Loop:** The most common type of loop — it has a clear end, running a fixed number of times and stopping once the condition becomes false.
2. **Infinite Loop:** This has no clear end. It runs forever, because its condition always stays true. **Example:** The "forever" block in Scratch makes a sprite repeat its action forever.

Computational Thinking in Real Life

We can actually see computational thinking at work in how people make decisions, do simple maths, and solve everyday problems — for example:

- Using an algorithm to find the best route from school to home, thinking about traffic, construction work, or road blocks.
- Following a recipe to bake a cake — this is itself an example of an algorithm.
- Planning a budget, which uses pattern recognition and decomposition when we check our spending in each category.

Essentials (Pre-requisites) of Writing an Algorithm

Before we write an algorithm, there are five things we need to know:

1. **The Problem:** A clear definition of the problem we need to solve.
2. **The Limitations (Constraints):** The limits we must keep in mind while solving it.
3. **The Input:** The data we take in to solve the problem.
4. **The Output:** The result we expect once the problem is solved.
5. **The Process (Solution):** The method we use to solve it, staying inside the given limits.

Once we know all five, we're ready to write the algorithm.

Long Question: Write an algorithm to find the sum of three numbers. [Exercise, Detailed Q2]

Step 1: Pre-requisites

1. Problem: Add three numbers and print their sum.
2. Constraints: The numbers must contain only digits — no other characters are allowed.
3. Input: The three numbers we want to add.
4. Output: The sum of the three numbers (a single integer value).
5. Solution: Add the three numbers using the '+' operator.

Step 2: Algorithm — Sum of three numbers

1. START
2. Declare 3 integer variables: num1, num2 and num3.

3. Take the three numbers as input in num1, num2 and num3.
4. Declare an integer variable called sum.
5. sum = num1 + num2 + num3
6. Print the value of sum.
7. END

Long Question: Write the algorithm to find whether a given number is even or odd. [Exercise, Detailed Q3]

Step 1: Pre-requisites

1. Problem: Print whether a number is even or odd.
2. Constraints: The number must contain only digits — no other characters are allowed.
3. Input: A number that needs to be checked.
4. Output: Print “even” or “odd”.
5. Solution: Divide the number by 2 and take the remainder — if the remainder is zero, the number is even, and if not, it is odd.

Step 2: Algorithm — Even or odd

1. START
2. Declare an integer variable num1.
3. Take the number as input in num1.
4. Declare an integer variable called remainder.
5. remainder = num1 % 2 (the % sign gives the remainder)
6. IF remainder = 0, print “Number is Even”. Otherwise, print “Number is Odd”.
7. END

Extra Bit: “Mod” (%) is used to find the remainder (modulus) of a division. **Example:** 7 % 2 = 1 and 8 % 2 = 0.

TOPIC 3: FLOWCHARTS

What is a Flowchart?

A flowchart is a picture (symbolic) form of an algorithm, where each step is shown by a symbol with a short description inside it. Arrows join the steps together and show the direction (flow) of the flowchart. We use flowcharts to study, design, document, and manage a process or a program.

Commonly Used Symbols in Flowcharts

Symbol	Name	Use
Oval	Terminal / Terminator	Shows the start or stop point of a flowchart
Rectangle	Action / Process	Shows a process (piece of work) in the flowchart
Arrow	Arrow / Flow line	Shows the direction of flow from one step to another
Parallelogram	Input / Output	Shows input or output
Diamond	Decision	Shows a decision (Yes or No)

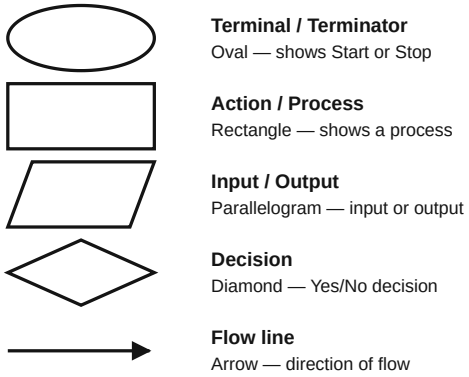

Fig: The commonly used flowchart symbols

Long Question: Write down the rules of writing a flowchart. [Exercise, Detailed Q4]

Here are the rules we should follow when drawing a flowchart:

1. Use the standard (conventional) flowchart symbols.
2. Every flowchart must have a Start point and an End (Stop) point.
3. Each symbol should have only one exit point. The decision symbol is an exception — it has two exit points (Yes and No).
4. Flow lines should not cross each other.
5. The flow lines coming out of a decision symbol should be labelled properly (Yes / No).

Advantages and Disadvantages of Flowcharts

Advantages	Disadvantages
Easy to make	Difficult to show big (complex) programs
Easy to understand	Hard to change (modify)
Mistakes can be found easily	Takes a lot of time
Debugging becomes possible (removing errors is called debugging)	Hard to understand for people who do not know the symbols
The logic can be understood easily	

Long Question: Draw a flowchart to find the sum of three numbers. [Exercise, Detailed Q6]

Before this one, the book also shows a simple daily-life flowchart as an example:

Example — Polish your shoes: Start → Open the shoe to polish → Put polish on brush → Polish one shoe → Put polish on brush → Polish shoe → Stop. This shows how a flowchart can describe an everyday task as a series of steps.

Answer — Flowchart for sum of three numbers:

1. **Start** (oval)
2. **Input three numbers A, B and C** (parallelogram)
3. **Sum = A + B + C** (rectangle — this step does the processing)

4. **Print Sum** (parallelogram)
5. **Stop** (oval)

Long Question: Draw a flowchart to find whether a given number is even or odd. [Exercise, Detailed Q7]

Answer:

1. **Start** (oval)
2. **Input a number A** (parallelogram)
3. **Rem = A % 2** (rectangle — find the remainder)
4. **Decision: Is Rem = 0?** (diamond)
   - If **No**, go to “Print Odd” (parallelogram), then go to Stop.
   - If **Yes**, go to “Print Even” (parallelogram), then go to Stop.
5. **Stop** (oval)

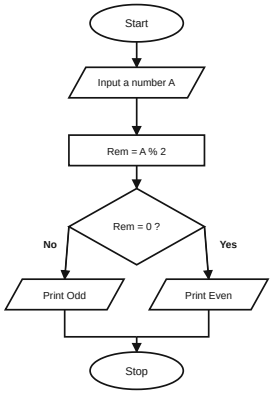

Fig: Flowchart — even or odd

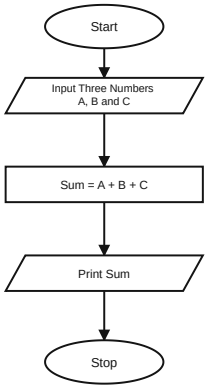

Fig: Flowchart — sum of three numbers

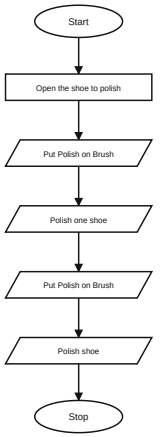

Fig: Flowchart — Polish your shoe

Flowcharts with Loops

The book also shows two more example flowcharts that use a finite loop — a loop with a fixed number of repeats:

Example — Print the first 10 numbers:

1. Start.
2. Set C = 1.
3. Decision: Is C less than 11?
   - If **No**, go to Stop.
   - If **Yes**, print C. Then set C = C + 1, and go back to the decision step again.
4. Stop.

This loop keeps printing C and adding 1 to it until C is no longer less than 11 — which prints the numbers 1 to 10.

Example — Table of a number, up to 10:

1. Start.

2. Input a number A.
3. Set C = 0.
4. Decision: Is C less than 10?
   - If **No**, go to Stop.
   - If **Yes**, set C = C + 1. Then print “A x C = A*C” (the result of A multiplied by C). Then go back to the decision step again.
5. Stop.

This loop keeps increasing C by 1 and printing the multiplication table of A, until C is no longer less than 10 — building the table one line at a time.

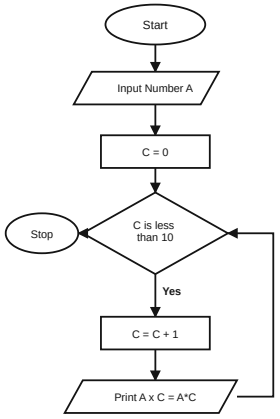

Fig: Flowchart — table of a number up to 10, a loop

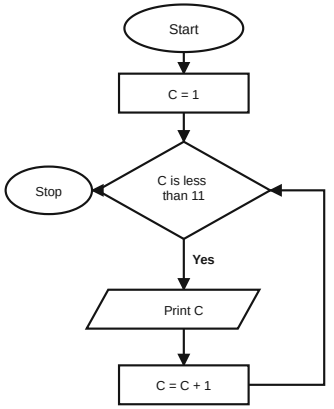

Fig: Flowchart — print the first 10 numbers, a loop

TOPIC 4: EFFICIENCY OF A SOLUTION

One problem can have more than one solution — and one solution can be more efficient (better) than another.

Long Question: How can we measure the efficiency of a solution? [Exercise, Detailed Q8]

We measure the efficiency of a solution using two things:

1. **Number of Steps:** How many steps the solution takes to solve the problem.
2. **Memory:** How much memory the solution uses.

But we mostly measure efficiency by the number of steps — the solution that solves the problem in fewer steps is the one we call more efficient.

Example — Find the largest number from three numbers:

Solution 1 (7 steps, uses 4 variables: A, B, C, largest)

1. Start.
2. Take three different numbers in A, B and C.
3. Set largest = A.
4. If B is greater than largest, set largest = B.

5. If C is greater than largest, set largest = C.
6. Print largest.
7. Stop.

Solution 2 (8 steps, uses 3 variables: A, B, C)

1. Start.
2. Input three different numbers A, B and C.
3. If A is greater than B, go to step 6.
4. If B is greater than C, print “B is largest” and go to step 8.
5. Print “C is largest” and go to step 8.
6. If A is greater than C, print “A is largest” and go to step 8.
7. Print “C is largest”.
8. End.

Analysis: Both solutions solve the same problem, but in different ways. Solution 1 takes 7 steps and uses four variables (A, B, C and largest), while Solution 2 takes 8 steps and uses three variables (A, B and C). Since Solution 1 takes fewer steps, we call it more efficient — even though it actually uses more memory (four variables) than Solution 2 (three variables).

Long Question: Why don’t we consider memory when measuring the efficiency of an algorithm? [Exercise, Detailed Q5]

1. **Two things to measure:** We can measure a solution’s efficiency by its number of steps, and by the memory it uses.
2. **Memory is not a big problem:** Modern computers have plenty of memory, and memory is cheap — so it isn’t really an issue for computer systems today.
3. **Steps matter more:** Since the number of steps decides how fast a problem gets solved, we always measure efficiency by the number of steps.
4. **Example:** In the largest-number example, Solution 1 uses one extra variable (more memory) but takes fewer steps — and we still call it more efficient.

SHORT QUESTIONS — UNIT 3

1. **Define computational thinking in your words.** *[Topic 1 · Exercise]*
   Computational thinking is a set of problem-solving skills. It helps us understand a hard problem and make solutions that a computer or a human can understand.
2. **Enlist (list) the techniques of computational thinking.** *[Topic 1 · Exercise]*
   Decomposition, pattern recognition, generalization and abstraction, and algorithm design.
3. **What do you mean by decomposition?** *[Topic 1 · Exercise]*
   Decomposition means breaking a big, hard problem into smaller parts that are easy to solve. Example: dividing the work of a holiday dinner into small tasks.
4. **Elaborate (explain) generalization and abstraction.** *[Topic 1 · Exercise]*
   Abstraction means keeping the important details and ignoring the unimportant ones.
   Generalization means making a general idea of the problem and its solution, so we can use it again.

5. **Define algorithm in your words.** *[Topic 2 · Exercise]*
   An algorithm is a set of step-by-step instructions. It solves a problem, or finishes a task, in a limited number of steps.
6. **Enlist the characteristics of an algorithm.** *[Topic 2 · Exercise]*
   Clear and unambiguous, well-defined inputs, well-defined outputs, finite-ness, feasible, and language independent.
7. **Differentiate between recursive and brute force algorithm.** *[Topic 2 · Exercise]*
   A brute force algorithm tries every possible solution until it finds the right one. A recursive algorithm breaks the problem into sub-parts and calls the same procedure again and again.
8. **Differentiate between searching and sorting algorithm.** *[Topic 2 · Exercise]*
   A searching algorithm finds an item, or a group of items, in given data. A sorting algorithm arranges data in a certain order.
9. **What are loops? Discuss its types.** *[Topic 2 · Exercise]*
   A loop is a set of instructions that repeats again and again while a condition stays true. There are two types: finite loop (stops after a fixed number of times) and infinite loop (never stops).
10. **Enlist the advantages and disadvantages of flowcharts.** *[Topic 3 · Exercise]*
    Advantages: easy to make, easy to understand, mistakes are found easily, debugging is possible, and logic is easy to understand.
    Disadvantages: hard to show big programs, hard to change, and it takes a lot of time.
11. **What is a flowchart?** *[Topic 3 · Book concept]*
    A flowchart is a picture form of an algorithm. Each step is shown by a symbol, and arrows show the flow.
12. **What is pattern recognition?** *[Topic 1 · Book concept]*
    It means finding similar things (patterns) in problems. This lets us use an old solution again.
13. **What is a divide and conquer algorithm?** *[Topic 2 · Book concept]*
    It breaks a problem into sub-problems, solves them, and merges the solutions to get the final solution.
14. **What is a randomized algorithm?** *[Topic 2 · Book concept]*
    It is an algorithm that uses a random number to give an immediate benefit.

MULTIPLE CHOICE QUESTIONS — UNIT 3

These are the book's own Exercise MCQs plus a few extra practice MCQs, with the correct answer marked ✔ above the option.

1. Breaking down a problem into sub-problems is called: *[Topic 1 · Exercise MCQ 1]*

a) generalization	b) pattern recognition	✔ **c) deconstruction**	d) Design

2. Discovering the principles that cause the patterns of a problem is called: *[Topic 1 · Exercise MCQ 2]*

✔ **a) generalization**	b) pattern recognition	c) deconstruction	d) Design

3. A set of instructions to solve a problem is called: *[Topic 2 · Exercise MCQ 3]*

a) directions	b) instructions	✔ **c) algorithm**	d) Design

4. The algorithm which goes through all possible solutions until the required solution is found is called: *[Topic 2 · Exercise MCQ 4]*

a) Recursive algorithm	b) Searching algorithm	✔ **c) Brute force algorithm**	d) sorting algorithm

5. The algorithms which help arrange a group of data in a particular manner are called: *[Topic 2 · Exercise MCQ 5]*

a) Recursive algorithm	b) Searching algorithm	c) Brute force algorithm	✔ **d) sorting algorithm**

6. The algorithm which breaks a problem into sub-problems, solves a single sub-problem, and merges the solutions is called: *[Topic 2 · Exercise MCQ 6]*

a) Recursive algorithm	b) Brute force algorithm	**c) divide and conquer algorithm** ✔	d) sorting algorithm

7. The algorithm which uses a random number so that it gives an immediate benefit is called: *[Topic 2 · Exercise MCQ 7]*

a) Recursive algorithm	b) divide and conquer algorithm	c) Brute force algorithm	**d) random algorithm** ✔

8. The sequence where we repeat a specific set of instructions again and again is called: *[Topic 2 · Exercise MCQ 8]*

a) loop ✔	b) sequence	c) condition	d) all

9. The loops which have to be terminated (stopped) are called: *[Topic 2 · Exercise MCQ 9]*

a) Infinite loops	**b) Finite loops** ✔	c) intermediate loops	d) simple loops

10. The loops which are never going to end are called: *[Topic 2 · Exercise MCQ 10]*

a) Infinite loops ✔	b) Finite loops	c) intermediate loops	d) simple loops

11. CT stands for: *[Topic 1]*

a) Computer Technology	**b) Computational Thinking** ✔	c) Common Thinking	d) Coding Technique

12. Looking for similar things in problems is called: *[Topic 1]*

a) decomposition	**b) pattern recognition** ✔	c) abstraction	d) algorithm design

13. Keeping important details and ignoring unimportant ones is called: *[Topic 1]*

a) decomposition	b) pattern recognition	**c) abstraction** ✔	d) debugging

14. An algorithm must end after a finite time. This characteristic is called: *[Topic 2]*

a) feasible	**b) finite-ness** ✔	c) language independent	d) unambiguous

Mistakes Found in the Book

1. **Answer key, Unit 3 MCQ 2:** The book's answer key gives (b) pattern recognition. But the book's own body text (page 44) and Summary say that discovering the principles that cause patterns is called generalization. So the correct answer should be (a) generalization.
2. **Answer key, Unit 3 MCQ 6:** The book's answer key gives (b) brute force algorithm. But the book (page 45) calls this exact process (breaking into sub-problems, solving, and merging) the divide and conquer algorithm. So the correct answer should be (c) divide and conquer algorithm.
3. **Answer key, Unit 3 MCQ 9:** The book's answer key gives (a) infinite loops. But loops that stop (are terminated) are finite loops, not infinite ones. So the correct answer should be (b) finite loops.
4. **Page 54, MCQ 1:** None of the four options is the word "decomposition", even though that is the correct term from the lesson. The closest option is (c) deconstruction, so these notes tick (c) for this question.
5. **Page 55, Detailed Question 1:** The book writes "pattern reorganization" in this question. It should say "pattern recognition".

6. **Page 46:** The book writes “Lepitaton Structure” as a heading. It should say “Repetition Structure”. The same page also misspells “algorithm” as “alogorithm”, and “sequence” as “sequnce”.
7. **Page 46:** The book’s example sentence says “finding whether a member is even or odd”. The word “member” should be “number”.
8. **Page 53, Analysis:** This section says Solution 1 is more efficient “although it consumed less memory”. This is incorrect. Solution 1 actually uses four variables (A, B, C, largest), which is *more* memory than Solution 2’s three variables (A, B, C). So Solution 1 actually uses *more* memory, not less.
9. **Duplicate figure number — “Fig. 3.1”:** The book labels two different diagrams as “Fig. 3.1”. On page 43, the Venn diagram of computational thinking is captioned “Fig. 3.1 Venn Diagram of Computational Thinking”. On page 46, the different diagram showing the six characteristics of an algorithm is also captioned “Fig. 3.1 Characteristics of an algorithm”. One of these two figures should have been numbered “Fig. 3.2” instead.

Unit 4 — Programming

TOPIC 1: Computers Store Information Using Binary Codes

Computers show everything as numbers — but to do this, they only ever use two: 0 (zero) and 1 (one).

Binary codes (4.1)

- **Binary numbers:** When we write numbers using only 0s and 1s, we call this using binary numbers.
- **Switches:** Inside a computer there are millions of tiny electronic switches — an open one means 0, a closed one means 1. With enough of these switches, a computer can show almost anything as numbers.
- **Bits:** Each switch is also called a **bit**, short for “Binary Digit”, and bits are what get stored in the computer’s memory.
- **Byte:** Put eight bits together and you get one **byte** of data.
- **Memory:** A megabyte holds about a million bytes, and a gigabyte about a billion — so the more memory a computer has, the more numbers (and information) it can store.

Do you know? Bit is the short form of Binary Digit.

Binary explained

- Gottfried Leibniz (1646–1716) refined (improved) the binary number system back in the 17th century — he invented it around 1679 and published it in 1701. Binary went on to become the base of almost all modern computers, and interestingly, Leibniz also invented calculus.
- A **bit** is the smallest unit of data in a computer, and it can only ever have one of two values: 1 or 0.
- Inside the CPU (the computer’s “brain”) and RAM (its fast memory), these numbers show up as electrical signals — either **on** (1) or **off** (0).

Long Question: Describe how computers can save information using binary codes. [Exercise, Brief Q1]

1. **Only two numbers:** A computer stores all kinds of information — text, pictures, sound and numbers — as numbers, using only two digits: 0 and 1. This is called binary code.
2. **Switches:** Inside the computer there are millions of tiny electronic switches — an open (off) one means 0, and a closed (on) one means 1.
3. **Bits and bytes:** Each switch is called a bit (binary digit), and eight bits together make one byte. Bits are stored in memory (RAM) and used by the CPU.
4. **Electrical signals:** Inside the CPU and RAM, these 1s and 0s show up as electrical signals that are either on or off.
5. **Codes for data:** Text gets changed into binary using ASCII or Unicode (special codes explained later), pictures are stored as tiny dots called pixels with colours stored as RGB numbers, and sound is changed into numbers by a device called an ADC.

✦

Conclusion: The more memory a computer has, the more bits it can store — so the more information it can save.

Importance of binary code

The binary number system is the base of all computer systems — it’s what lets a computer store, use and move all kinds of information between the CPU and the memory. Because of binary code, we can:

1. view websites;
2. create and update documents;
3. play games;

4. watch streaming videos and other graphics (pictures);
5. use software (apps and programs); and
6. do calculations and study data.

Using only 1s and 0s is a simple, neat way for a computer to work — it also helps control logic circuits, telling the computer whether an electrical signal is true (1) or false (0).

TOPIC 2: Binary and Decimal Number Systems

A **number system** is simply a way of writing numbers. Computers use the binary system, while people use the decimal system in everyday life.

Decimal number system (4.2)

1. **Base:** It has base 10, using 10 symbols: 0, 1, 2, 3, 4, 5, 6, 7, 8 and 9.
2. **Other name:** It is also called the **Hindu-Arabic number system**.
3. **Place value:** Each place is ten times bigger than the one on its right — for example, in the number **1,980**:

Digit	**1**	**9**	**8**	**0**
Place	1,000th place	100th place	10th place	1st place

So the 1 means one thousand, the 9 means nine hundred, the 8 means eighty, and the 0 means zero ones.

1	9	8	0
1,000th place	100th place	10th place	1st place

1,980 = 1000 + 900 + 80 + 0

Fig: place-value diagram for the decimal number 1,980

4. **Decimal point:** It uses a decimal point to write fractions (parts of a number).
5. **Writing:** Decimal numbers are written as 45_{10} or 118_{10}, and if no base is written next to a number, we just assume it's decimal — it's the number system people use the most.

Binary number system

1. **Base:** It has base 2, using only two digits: 0 and 1.
2. **Bit:** The smallest unit of data in a computer is called a bit (binary digit), and it's either 1 or 0.
3. **Writing:** Binary numbers are written as 110_2 or 10_2.
4. **Use:** Binary numbers are mostly used in computer programming and coding, because a computer only understands 0 and 1.
5. **MSB and LSB:** In a binary number, the bit on the far left is called the **Most Significant Bit (MSB)**, and the one on the far right is the **Least Significant Bit (LSB)**.

Example: Look at the binary number **1010**.
$1 \times 2^3 + 0 \times 2^2 + 1 \times 2^1 + 0 \times 2^0 = 8 + 0 + 2 + 0 = \mathbf{10}$
So binary **1010** equals decimal **10**.

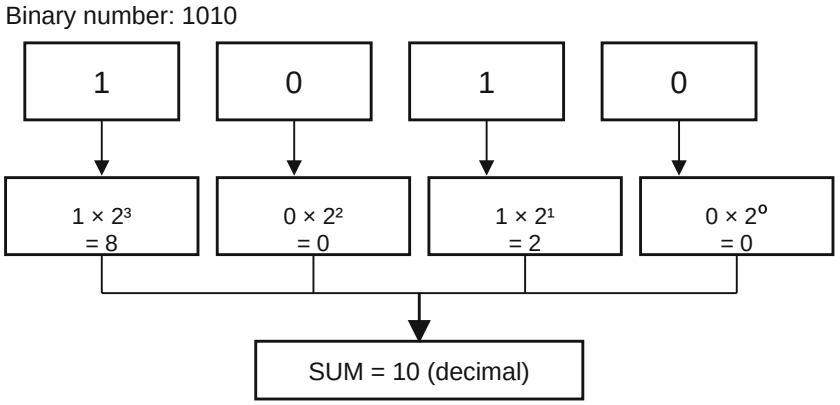

Fig: binary place-value diagram showing $1010_2 = 10_{10}$

Units of memory (Table 4.1)

Unit	Equal to
1 Bit	Binary Digit (0 or 1)
8 Bits	1 Byte (B)
1024 Bytes	1 Kilobyte (KB)
1024 KB	1 Megabyte (MB)
1024 MB	1 Gigabyte (GB)
1024 GB	1 Terabyte (TB)
1024 TB	1 Petabyte (PB)
1024 PB	1 Exabyte (EB)
1024 EB	1 Zettabyte (ZB)
1024 ZB	1 Yottabyte (YB)
1024 YB	1 Brontobyte
1024 Brontobyte	1 Geopbyte

Memory units in decimal (about how big they really are)

Unit	Binary value	About this many bytes (decimal)
Bit	0 or 1	1/8 of a byte
Byte	8 bits	1 byte
Kilobyte (KB)	1024^1 bytes	about 1,000 bytes
Megabyte (MB)	1024^2 bytes	about 1,000,000 bytes
Gigabyte (GB)	1024^3 bytes	about 1,000,000,000 bytes
Terabyte (TB)	1024^4 bytes	about 1,000,000,000,000 bytes
Petabyte (PB)	1024^5 bytes	about 1,000,000,000,000,000 bytes
Exabyte (EB)	1024^6 bytes	about 1,000,000,000,000,000,000 bytes
Zettabyte (ZB)	1024^7 bytes	about 1,000,000,000,000,000,000,000 bytes
Yottabyte (YB)	1024^8 bytes	about 1,000,000,000,000,000,000,000,000 bytes

Remember: in binary counting, 1 KB = 1024^1 bytes, 1 MB = 1024^2 bytes, and so on — but in normal decimal counting, 1 KB is about 1,000 bytes, 1 MB about 1,000,000 bytes, and 1 GB about 1,000,000,000 bytes.

Long Question: Differentiate between binary and decimal number systems. [Exercise, Brief Q2]

Binary Number System	Decimal Number System
It has base 2.	It has base 10.
It uses only two digits: 0 and 1.	It uses ten digits: 0 to 9.
Computers use it.	People use it in daily life.
Each place is 2 times the place on its right (1, 2, 4, 8 …).	Each place is 10 times the place on its right (1, 10, 100 …).
It is written with a base, like 1010_2.	It is written like 10_{10}, or with no base at all.
The leftmost bit is the MSB and the rightmost bit is the LSB.	It is also called the Hindu-Arabic number system.

Example: The binary number 1010_2 equals the decimal number 10_{10}.

TOPIC 3: Number System Conversion

We can change a binary number into a decimal number — and just as easily, go the other way, from decimal into binary.

Long Question: How does a computer convert binary numbers into decimal numbers? [Exercise, Brief Q3]

We use a method called **positional notation**, where each digit has a “weight” based on its position — that weight being the base (2) raised to a power.

1. **Step 1:** Write the powers of 2 for every digit, starting from the rightmost one — the first (rightmost) place is 2^0, the next is 2^1, then 2^2, and so on.
2. **Step 2:** Multiply each digit by its power of 2.

3. **Step 3:** Add all the results together — the sum is the decimal number.

Example: Convert 101101_2 into decimal.

Digit	**1**	**0**	**1**	**1**	**0**	**1**
Power of 2	2^5	2^4	2^3	2^2	2^1	2^0
Value	32	0	8	4	0	1

$1 \times 2^5 + 0 \times 2^4 + 1 \times 2^3 + 1 \times 2^2 + 0 \times 2^1 + 1 \times 2^0 = 32 + 0 + 8 + 4 + 0 + 1 =$ **45**

So $\mathbf{(101101)_2 = (45)_{10}}$.

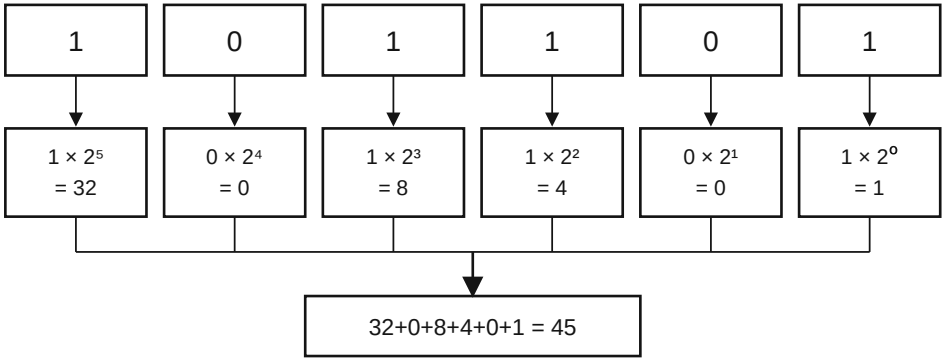

Fig: binary-to-decimal worked diagram for $101101_2 = 45_{10}$

Long Question: How does a computer convert decimal numbers into binary numbers? [Exercise, Brief Q4]

To change decimal into binary, we just divide the number by 2 again and again — the base changes from 10 to 2.

1. **Step 1:** Divide the decimal number by 2, and write down the remainder (0 or 1).
2. **Step 2:** Divide the new answer (the quotient) by 2 again, and write down the remainder.
3. **Step 3:** Keep repeating this until the quotient becomes 0.
4. **Step 4:** Write the remainders in reverse order — the last one goes first. (The first remainder you got is the LSB, and the last one is the MSB.)

Example 1: Convert 100_{10} to binary.

Divide by 2	**Number**	**Remainder**
	100	
	50	0
	25	0
	12	1
	6	0

Divide by 2	Number	Remainder
	3	0
	1	1
	0	1 (stop here)

Read the remainders from bottom to top: **1100100**. So **$(100)_{10} = (1100100)_2$**.

Example 2: Convert 14_{10} to binary.

14 ÷ 2 = 7 r 0 → 7 ÷ 2 = 3 r 1 → 3 ÷ 2 = 1 r 1 → 1 ÷ 2 = 0 r 1

Read bottom to top: **1110**. So **$(14)_{10} = (1110)_2$**.

Example 3: Convert 172_{10} to binary.

172 ÷ 2 = 86 r 0 → 86 ÷ 2 = 43 r 0 → 43 ÷ 2 = 21 r 1 → 21 ÷ 2 = 10 r 1 → 10 ÷ 2 = 5 r 0 → 5 ÷ 2 = 2 r 1 → 2 ÷ 2 = 1 r 0 → 1 ÷ 2 = 0 r 1

Read bottom to top: **10101100**. So **$(172)_{10} = (10101100)_2$**.

(Check: 128 + 32 + 8 + 4 = 172. Correct.)

Decimal to binary chart (0 to 20)

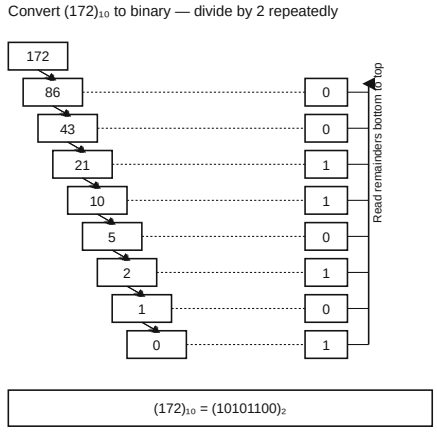

Fig: decimal-to-binary staircase diagram for 172_{10} = 10101100_2 (corrected — see Mistakes Found, Page 61)

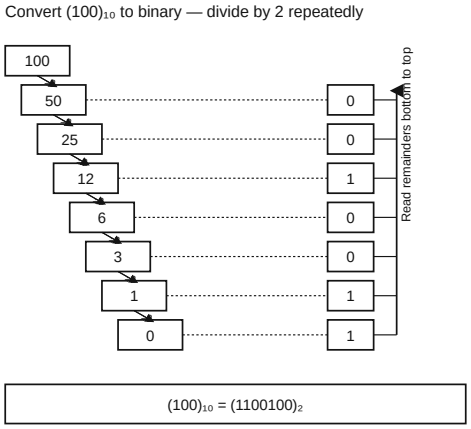

Fig: decimal-to-binary staircase diagram for 100_{10} = 1100100_2

Decimal	Binary	Decimal	Binary	Decimal	Binary
0	0	7	111	14	1110
1	1	8	1000	15	1111
2	10	9	1001	16	10000
3	11	10	1010	17	10001
4	100	11	1011	18	10010

Decimal	Binary	Decimal	Binary	Decimal	Binary
5	101	12	1100	19	10011
6	110	13	1101	20	10100

TOPIC 4: Text, Image and Sound in Binary (4.3)

Text, pictures and sound must also be changed into binary — only then can a computer store and use them.

Long Question: Write a note explaining how text, image and sound are represented in binary code. [Exercise, Brief Q5]

1. Text

- When we press a key on the keyboard, the computer changes it into a binary number, uses that number, and the letter appears on the screen. Example: **A = 0100 0001**.
- We need a code to turn each character into a binary number, and one such code is **ASCII** (American Standard Code for Information Interchange) — it gives a binary number to every character on the keyboard.
- ASCII is a **7-bit code**, so it can store $2^7 = 128$ characters — enough for English, but not enough for other languages. It was later made bigger (extended) to $2^8 = 256$ characters, but even that wasn't enough for every language.
- So a new code called **Unicode** was made, which can show more than 65,000 characters — meaning people who speak any language, like Russian or Chinese, can use computers to write in their own language.

Text examples (ASCII):

- Letter **a** = 0110 0001 (decimal 97)
- Letter **b** = 0110 0010 (decimal 98)
- Letter **c** = 0110 0011 (decimal 99)

ASCII codes start counting at 0, and they cover more than just letters and numbers — special characters too, like punctuation marks, the Enter key, and control keys.

2. Images

- A digital image (a picture on a screen) is made of many small dots called **pixels**, and each one is stored as a binary number.
- In a black and white picture, we can say 1 means black (on) and 0 means white (off).
- Before the computer can draw the picture, it must know the size of the pixel grid — this size information is called **metadata**. So if the metadata says 10x10, the picture is 10 pixels across and 10 pixels down.
- Example grid (1 = black, 0 = white):

0	0	0	0	0	0	0	0
0	1	1	0	0	1	1	0
0	1	1	0	0	1	1	0
0	0	0	0	0	0	0	0
0	0	0	0	0	0	0	0
0	1	0	0	0	0	1	0

0	0	0	0	0	0	0	0
0	0	1	1	1	1	0	0
0	0	0	0	0	0	0	0

- Coloured pictures need more numbers — colours are stored as 8-bit numbers, using a system called **RGB** (Red, Green, Blue).

Colours in binary code

1. **8-bit numbers:** Each colour part (Red, Green or Blue) is stored using 8 bits, which gives 256 possible levels for each one (from 0 to 255). Example: 0 = 00000000 and 255 = 11111111.
2. **RGB:** The most common way to make colours on a screen is by mixing Red, Green and Blue light, each with a value from 0 to 255.
3. **Primary colours:** Red (255,0,0), Green (0,255,0), Blue (0,0,255).
4. **Secondary colours:** Cyan (0,255,255), Magenta (255,0,255), Yellow (255,255,0).
5. **Black and white:** Black is (0,0,0), white is (255,255,255), and middle (medium) gray sits at (128,128,128).
6. **Hexadecimal:** Some programs show colours using hexadecimal numbers instead, a system with 16 symbols — 0 to 9, and then A to F.

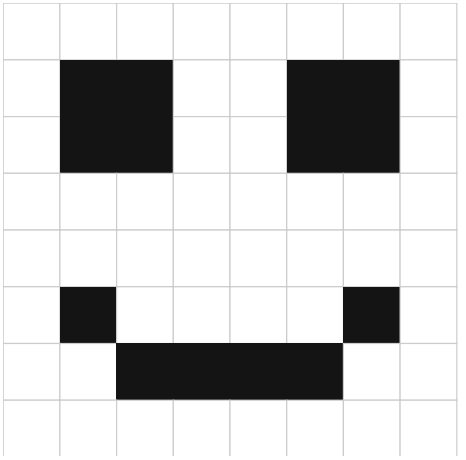

Fig: the black-and-white pixel-grid picture drawn from the 8x8 grid above

Colours in decimal, binary and hexadecimal

Colour	Decimal RGB	Binary RGB	Hexadecimal RGB
Black	(0,0,0)	(00000000, 00000000, 00000000)	(00,00,00)
White	(255,255,255)	(11111111, 11111111, 11111111)	(FF,FF,FF)
Red	(255,0,0)	(11111111, 00000000, 00000000)	(FF,00,00)
Green	(0,255,0)	(00000000, 11111111, 00000000)	(00,FF,00)
Blue	(0,0,255)	(00000000, 00000000, 11111111)	(00,00,FF)
Cyan	(0,255,255)	(00000000, 11111111, 11111111)	(00,FF,FF)
Magenta	(255,0,255)	(11111111, 00000000, 11111111)	(FF,00,FF)
Yellow	(255,255,0)	(11111111, 11111111, 00000000)	(FF,FF,00)
Gray	(128,128,128)	(10000000, 10000000, 10000000)	(80,80,80)
Pale Yellow	(200,180,120)	(11001000, 10110100, 01111000)	(C8,B4,78)

In the end, it's the screen that decides what colour we actually see — the same numbers, like (200,180,120), may look slightly different on different screens or printers. This makes showing exact colours a hard technical problem.

3. Sound

- Sound waves are **analogue** — meaning they are smooth, continuous waves, not numbers.

- To store sound on a computer, we must change the wave into numbers (digital data), and this is done by an **ADC** (Analogue-to-Digital Converter).
- The ADC works by taking “samples” (readings) of the sound wave at regular, equal time gaps.
- **Sample rate:** how many samples are taken every second — more samples mean better sound quality.
- **Bit rate:** how many bits are used to store each sample — more bits mean better accuracy, but also a bigger file size.
- **Audacity** is a free audio (sound) editor program — we can open an MP3 file in it, zoom in to see the value of each sample, and even save the sound at different sample rates to hear how the quality changes.

TOPIC 5: Scratch Programming

Scratch is a programming software that makes it easy to build interactive games, animations and stories.

Scratch and its interface (4.4)

When Scratch opens, it shows one character by default (automatically) — this is called a **sprite** (the Scratch Cat). We can write code to make a sprite move and interact with the user (the person using it).

Parts of the Scratch interface

Part	What it does
Block Categories	Shows groups of blocks (Motion, Looks, Sound, Events, Control, Sensing, Operators, Variables). Click a category to see its blocks.
Block Palette	Shows the list of blocks. Click a block and drag it to the script area to use it.
Script Area	The place where we join blocks together to build a program.
Stage	The place where the program runs. We see the sprite move here.
Sprite List	Shows all the sprites in the program. We can add, delete or change sprites and the backdrop (background) here.
X and Y Coordinates	Show the exact position of the sprite on the stage. (0, 0) is the middle of the stage.

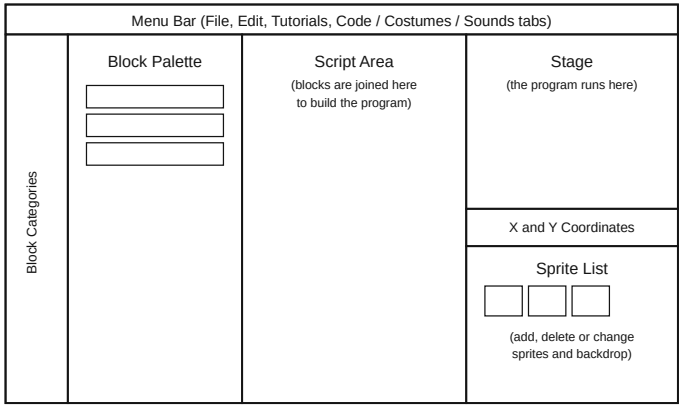

Fig: layout of the Scratch programming interface

Other parts of the screen: Code tab (shows the Block Palette), Costumes tab (a paint editor), Sounds tab (a sound editor), Menu bar, Stage Size buttons (to make the stage bigger or smaller), Choose a Sprite button, Choose a Backdrop button, and Extensions Library.

Combination of programming constructs (4.4.1)

We can combine **events** and **coordinates** (position numbers) so a sprite can move in two ways: - the user moves it by pressing keys, or - the sprite moves by itself (automatically), with no help from the user.

1. **Movement:** Movement is the most basic (simple) thing a game does, and it's usually the first thing we add to a new game. In real life, we move our arms and legs to do things — in a game, players press arrow keys to move their character instead. This lets a character interact more with the game world.
2. **Step 1 — Select a sprite:** Every object in a Scratch project is called a sprite — a character that can move and run code. The Scratch Cat is in every new project by default, but to add a new one, click the **Choose a Sprite** button at the bottom right. This opens the Sprite Menu, a library of ready-made characters, and clicking any one adds it to your project.
3. **Step 2 — Program the sprite:** The easiest way to make a sprite move is to use **event listeners** — a block that waits for something to happen, like a key press. The code pairs a yellow event block (it tells the sprite *when* to move) with blue motion blocks (they actually move the sprite).

Tip: Right-click on a block of code and choose **Duplicate** to make a copy of it — that way we don't need to drag and drop new blocks every time. (The right-click menu also has Add Comment and Delete Block.)

Moving in four directions

"When you press the right arrow key, point towards the right, then move forward 10 steps."

- Each script runs when a different arrow key is pressed.
- The **point in direction** block uses degrees to set direction: 90 = right, -90 = left, 0 = up, 180 = down.
- The **move 10 steps** block is the same in all four scripts, so the sprite always moves at the same speed.

Step method (the sprite turns, then moves):

Key pressed	point in direction	move
right arrow	90	move 10 steps
left arrow	-90	move 10 steps

Key pressed	point in direction	move
up arrow	0	move 10 steps
down arrow	180	move 10 steps

X-Y method (the sprite moves, but does not turn):

Key pressed	Block used
right arrow	change x by 10
left arrow	change x by -10
up arrow	change y by 10
down arrow	change y by -10

Long Question: Allow the user to move a sprite using arrow keys. [Exercise, Project Q4]

There are three ways to make a sprite move right, left, up and down using the arrow keys:

1. **X-Y Method:** Select the sprite. Use “when [arrow] key pressed” with:
   - “change x by 10” for the right arrow key
   - “change x by -10” for the left arrow key
   - “change y by 10” for the up arrow key
   - “change y by -10” for the down arrow key

   The sprite moves, but it always keeps pointing in the same direction.
2. **Step Method:** Use “when [arrow] key pressed”, then “point in direction” (90 for right, -90 for left, 0 for up, 180 for down), then “move 10 steps” — the sprite turns to face the new direction, then moves. This isn’t ideal for a sprite that needs to turn for other reasons too.
3. **Loop Method:** We can put either method inside a **forever** loop, along with “if key pressed” blocks — this way, the program keeps checking the keys all the time, not just once.

TOPIC 6: Variables and Loops in Scratch

Variables help a program remember a value, while **loops** repeat the same blocks again and again.

Variables

Sometimes a program must remember a value so it can use it many times — the best way to do this is with a **variable**, a named place that the computer uses to hold a value.

- We give a variable a name, and use that name to call it in the program.
- We give (assign) a value to a variable — it can be a word (string), a number, or a letter.
- We can change a variable’s value as many times as we want.
- We can make as many variables as we want.

To create a variable in Scratch:

1. Go to the Variables category.

2. Click **Make a Variable**.
3. A “New Variable” box appears. Type a name for it.
4. Choose “For all sprites” or “For this sprite only”.
5. Click OK.

Now blocks like **set**, **change**, **show variable** and **hide variable** appear, ready to use.

1. **Set block:** “set [variable] to (0)” gives the variable a starting value. Click the small arrow to pick which variable to use — it can be set to a number (like 12) or to a word (like “Hello”). We should always give a variable a value before we use it.
2. **Reporter block:** The round (variable) block shows (reports) the value stored in the variable — for example, “say (message1) for 2 seconds” shows the value stored in message1 on the stage.

Using variables with random numbers

The **pick random** block gives a random (unpredictable) number within a range we choose. In the script below, Number1 and Number2 each get a random number from 1 to 11, and the sprite then says their product (the answer when we multiply them).

```
when green flag clicked
set Number1 to (pick random 1 to 11)
set Number2 to (pick random 1 to 11)
say (join "The product of both numbers is: " (Number1 × Number2)) for 2 seconds
```

To also show the two random numbers alongside the product, we can join more text blocks together (nested join blocks), like this:

```
when green flag clicked
set Number1 to (pick random 1 to 11)
set Number2 to (pick random 1 to 11)
say (join "The product " (join Number1 (join " and " (join Number2 (join " is: " (Number1 × Number2)))))) for
2 seconds
```

Working with loops in Scratch

The Control category has two kinds of loop blocks:

1. **Repeat Loop:** It repeats the blocks inside it a fixed number of times, which we write at the start of the loop.
2. **Forever Loop:** It keeps repeating the blocks inside it until something stops it (like a “stop all” block inside an “if” condition) — and if we don’t add a stopping condition, it becomes an **infinite loop** that never stops on its own.

Program Example: Turn a sprite by 15 degrees, 20 times, with a 0.25 second delay each time.

```
when green flag clicked
repeat 20
   wait 0.25 seconds
   turn right 15 degrees
```

Program Example (Learning Outcome): Create a countdown timer in Scratch.

Make a timer that starts at 100 and stops the program at 0. The value should change every 0.5 seconds.

1. Make a variable named **Timer**.
2. Use “when green flag clicked” to start the program.
3. Use “set Timer to 100” to give it a starting value.
4. Add a **forever** loop.
5. Inside it, use “if Timer < 1 then” → “stop all” — this stops the whole program once the timer reaches 0.
6. In the “else” part, use “wait 0.5 seconds” and “change Timer by -1” — this makes the timer go down by 1 every half second.

```
when green flag clicked
set Timer to 100
forever
   if Timer < 1 then
      stop all
   else
      wait 0.5 seconds
      change Timer by -1
```

Long Question: Create a game with a player sprite and a food sprite, using coordinates, conditionals, loops and variables. [Exercise, Project Q3, Q5, Q6]

1. **Two sprites:** Add a player sprite and a “food” sprite — the player’s job is to chase the food.
2. **Move the player (events + coordinates):** Use “when [arrow] key pressed” with “change x by” or “change y by” blocks, letting the player move right, left, up and down using the arrow keys.
3. **Move the food automatically:** In the food sprite, use “when green flag clicked”, then a “forever” loop, then “glide 1 secs to random position” (or “go to random position”) — the food now moves by itself, with no help from the user.
4. **Score variable:** Make a variable called **Score**, and set it to 0 when the game starts.
5. **Conditional (if-then check):** Inside a forever loop, use “if touching Food? then change Score by 1” — the player earns a point each time it touches the food.

✦

```
Player sprite (score):
when green flag clicked
set Score to 0
forever
   if touching Food? then
      change Score by 1
```

```
Food sprite (moves by itself):
when green flag clicked
forever
   glide 1 secs to random position
```

TOPIC 7: Programming Activities (Exercise Project Questions 1 and 2)

Long Question: Give instructions to complete a simple task, like drawing a cat or a dog. [Exercise, Project Q1 / Activity Q1]

This activity teaches us that a computer needs very exact, step-by-step instructions — humans can guess what we mean, but a computer cannot.

1. Work in pairs. Each student gets one piece of paper and a pencil.

2. Student 1 draws a simple animal, like a cat, without showing it to Student 2.
3. Student 1 then tells Student 2 how to draw the same picture — using only words (instructions), not hand signs or pointing.
4. Student 2 must follow the instructions exactly, step by step, to try to draw the same picture.
5. At the end, compare both drawings.

What we learn: a computer can only follow very clear, exact instructions written in a programming language — if an instruction isn't clear enough, the computer (or Student 2) can't do the task correctly. That's why programming needs standard, exact terms.

Long Question: Break down a computer, phone or online game into simple instructions in your own language. [Exercise, Project Q2 / Activity Q2]

Pick any game you've played, and answer these questions about it, step by step, to break it into simple instructions:

1. What is the objective (goal) of the game?
2. How many sprites (characters or objects) are there in the game?
3. How does the player move?
4. How does the player win (if there is a way to win)?
5. How does the player lose (if there is a way to lose)?
6. What instructions have been given to the computer to make this game work?

Example (Fruit Catching game):

1. **Objective:** Catch as many falling fruits as possible before they hit the ground.
2. **Sprites:** Two sprites — a basket (the player) and a fruit.
3. **Movement:** The player moves the basket left and right using the arrow keys.
4. **Win:** The player "wins" by reaching a high score, such as catching 20 fruits.
5. **Lose:** The player loses points, or the game ends, if a fruit falls past the basket and hits the ground.
6. **Instructions given to the computer:** Move the basket when a key is pressed; make the fruit fall automatically from the top; check if the basket touches the fruit; add 1 to the score if it touches; end the game if the fruit reaches the bottom without being caught.

SHORT QUESTIONS — UNIT 4

1. **Describe how computers save information using binary codes.** *[Topic 1 · Exercise]*
   Computers store all information as 0s and 1s. Tiny switches inside the computer are off (0) or on (1). Each switch is a bit, and 8 bits make a byte.
2. **Differentiate between binary and decimal number systems.** *[Topic 2 · Exercise]*
   The binary system has base 2 and uses 0 and 1. The decimal system has base 10 and uses 0 to 9. Computers use binary. People use decimal.
3. **How does a computer convert binary numbers into decimals?** *[Topic 3 · Exercise]*
   Multiply each binary digit by its power of 2 (2^0, 2^1, 2^2 ... counting from the right). Then add all the results. Example: $101101_2 = 45$.
4. **How does a computer convert decimal numbers into binary?** *[Topic 3 · Exercise]*
   Divide the number by 2 again and again. Write down each remainder, until the quotient becomes 0. Then write the remainders from the last one to the first one. Example: $14_{10} = 1110_2$.
5. **Write a note on text representation in binary.** *[Topic 4 · Exercise]*
   Each key is changed into a binary code using ASCII or Unicode. Example: A = 0100 0001. ASCII can store 128 characters. Unicode can store more than 65,000 characters.
6. **What is a bit?** *[Topic 1 · Book concept]*
   A bit (binary digit) is the smallest unit of data in a computer. It is either 0 or 1.
7. **What is a byte?** *[Topic 1 · Book concept]*
   Eight bits together make one byte.

8. **Who refined the binary number system?** *[Topic 1 · Book concept]*
Gottfried Leibniz refined the binary system in the 17th century. He invented it around 1679 and published it in 1701.

9. **What are MSB and LSB?** *[Topic 2 · Book concept]*
In a binary number, the leftmost bit is the Most Significant Bit (MSB). The rightmost bit is the Least Significant Bit (LSB).

MULTIPLE CHOICE QUESTIONS — UNIT 4

These are the book's own Exercise MCQs plus a few extra practice MCQs, with the correct answer marked ✔ above the option.

1. The term __ also refers to any digital encoding/decoding system in which there are exactly two possible states. *[Topic 1 · Exercise MCQ 1]*

a) Digital	**b) Binary** ✔	c) Python	d) Programming

2. __ bits together make what we call a "byte" of data. *[Topic 1 · Exercise MCQ 2]*

a) 6	b) 7	**c) 8** ✔	d) 9

3. To convert numbers from decimal to binary, the given decimal number is divided repeatedly by __. *[Topic 3 · Exercise MCQ 3]*

a) 2 ✔	b) 3	c) 4	d) 5

4. __ are made up of pixels. *[Topic 4 · Exercise MCQ 4]*

a) Binary numbers	b) Decimals	c) Programs	**d) Digital images** ✔

5. ASCII code can only store up to __ characters. *[Topic 4 · Exercise MCQ 5]*

a) 128 ✔	b) 256	c) 64	d) 124

6. __ are represented in a computer using 8-bit numbers. *[Topic 4 · Exercise MCQ 6]*

a) Numbers	b) Letters	c) Images	**d) Colours** ✔

7. We need __ to convert sound waves into numerical representation. *[Topic 4 · Exercise MCQ 7]*

a) Audio to digital converter	b) Audio to digits converter	**c) Analogue to digital converter** ✔	d) Analogue to digits converter

8. The best way to remember a value when designing a program is to use a __. *[Topic 6 · Exercise MCQ 8]*

a) Variable ✔	b) Value	c) Number	d) Binary

9. The __ is/are analogue. *[Topic 4 · Exercise MCQ 9]*

a) Light	b) Numbers	c) Values	**d) Sound** ✔

10. The decimal number system represents a number with a base of __. *[Topic 2 · Exercise MCQ 10]*

a) 2	b) 3	c) 5	**d) 10** ✔

11. Bit is the short form of: *[Topic 1]*

a) Binary Item	**b) Binary Digit** ✔	c) Basic Digit	d) Byte Digit

12. The smallest unit of data in a computer is: *[Topic 1]*

a) byte	**b) bit** ✔	c) nibble	d) kilobyte

13. The binary number system was refined by: *[Topic 1]*

a) Charles Babbage	**b) Gottfried Leibniz** ✔	c) Bill Gates	d) Isaac Newton

14. In a computer, a closed (on) switch represents: *[Topic 1]*

a) 0	**b) 1** ✔	c) 2	d) 10

Mistakes Found in the Book

1. **Page 61:** The picture shows $(172)_{10} = (1010100)_2$, but this is wrong — 1010100_2 only equals 84. Using the book's own division steps on the same page, the correct answer is $(172)_{10} = (10101100)_2$.
2. **Page 72:** The text says the script shows "the product" of Number1 and Number2, but the picture just places them side by side, with no multiply (×) sign between them. The script should actually multiply the two numbers to get the real product.
3. **Page 73:** In the four arrow-key scripts, several blocks say "up arrow" when they should say other directions (left, down), and the step-method scripts also say "move 10 stage" instead of "move 10 steps". The correct scripts, with the right key names and block name, are shown in these notes (Topic 5).
4. **Page 74:** Under the heading "Repeat Loop", the book shows a picture of the empty **forever** block, not the **repeat** block. The forever block picture belongs under "Forever Loop" instead.
5. **Page 57:** The book says a gigabyte is "approximately trillions of bytes" — this is wrong. A gigabyte is about one **billion** bytes, not a trillion.
6. **Page 58, Table 4.1:** The table spells "Terabyte" as "Terra Byte". The correct spelling is "Terabyte".
7. **Page 59:** The memory table's column heading is spelled "Abrivation". The correct spelling is "Abbreviation".
8. **Pages 65–66:** The Sprite and Scratch Interface figures are captioned "Fig. 5.4 Sprite" and "Fig. 5.3 Scratch Interface". Since this is Unit 4, the figure numbers should start with 4 (like "Fig. 4.x"), not 5.
9. **Page 77, Exercise MCQ 3:** The question says a decimal number is divided by 2 "till we get 0 or 1 as the final quotient". But the book's own worked method (page 61) stops only when the quotient becomes 0, not 0 or 1. The correct rule is: keep dividing until the quotient is 0.

Unit 5 — Digital Citizenship

TOPIC 1: ETHICS AND ETHICAL ISSUES

Ethics tells us what's right and what's wrong — and it guides how we behave with other people.

Ethics (5.1)

Ethics is the study of what is morally good and bad, or right and wrong. The word "ethics" is also used for a system of moral values or rules.

Ethics is based on clear standards, which tell people: - What are their rights - What are their duties (things they must do) - How their actions help society - How to be fair - How to have good qualities, like honesty (these good qualities are called "virtues")

Extra Bit: A Greek thinker named Aristotle said ethics is the study of human relations in their most perfect form. He called it "the science of proper behaviour."

Ethics for Success (from the book's figure): Honesty, Integrity, Responsibility, Quality, Trust and Respect, and Leadership — these six things build ethics for success.

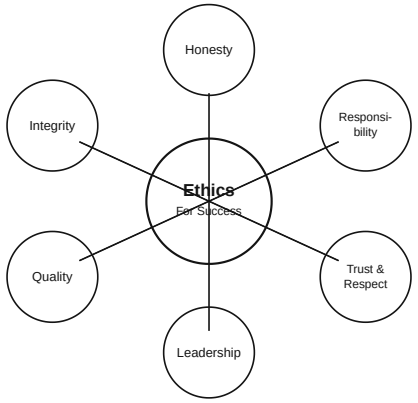

Fig: Ethics for success — six values arranged around "Ethics"

Ethical issues

An **ethical issue** is a situation where a moral problem comes up in society or at work — one where a moral rule is being challenged or broken.

Ethical issues include: 1. Privacy and confidentiality (keeping information secret) 2. Issues related to socially vulnerable (weak) people 3. Health insurance discrimination (treating some people unfairly about health insurance) 4. Employment (job) discrimination 5. Individual responsibility 6. Issues related to race and ethnicity 7. Implementation of laws (making sure laws are followed)

TOPIC 2: ETHICS IN THE DIGITAL WORLD (5.2)

Today, most of our relationships have moved online — we chat, message, and use social media to talk to people.

What is digital ethics?

We live in a digital world now, where most of our relationships have moved online — to chats, messengers, and social media. Knowing and following the rules of good behaviour while online is called **digital ethics**.

Ethical issues in the digital world

Technology has given us many benefits — things like 5G, Virtual Reality, Mixed Reality, Artificial Intelligence, driverless vehicles, digital assistants, robots, smart devices, and automation.

But technology also has bad effects. Some common ethical issues in the digital world are: - Misuse of personal information - Misinformation (wrong information) and deep fakes (fake videos or pictures made to look real) - Lack of oversight (not enough checking) and not accepting responsibility - Social and political instability

Good online behaviour means respecting others, protecting privacy, not copying others' work, and not spreading false news.

Long Question: Define ethics in the digital environment. *(Exercise – Detail Q1)*

1. **Meaning:** We live in a digital world, where most of our relationships have moved online — to chats, messengers, and social media. Knowing and following the rules of good online behaviour is called digital ethics.
2. **Benefits of technology:** Technology gives us many benefits, like 5G, Virtual Reality, Mixed Reality, Artificial Intelligence, driverless vehicles, digital assistants, robots, smart devices, and automation.
3. **Negative impacts:** But technology also has bad effects, and some common ethical issues in the digital world are:

✦

- Misuse of personal information
- Misinformation and deep fakes
- Lack of oversight and not accepting responsibility
- Social and political instability

4. **Good behaviour:** We should respect others online, protect privacy, avoid copying others' work, and never spread false news.

Being a safe and responsible digital citizen

We spend most of our time online, and we store most of our things there too — photos, documents, all of it. So it's very important to protect our devices and information from harmful people.

If we leave our devices unprotected, small problems can happen, like a slower computer — but big problems can happen too, like losing all the money in a bank account, or identity theft (someone stealing your identity and pretending to be you).

A good **digital citizen** (a person who uses the internet safely and responsibly) does these things: - Encourages positive and healthy talk online - Knows about common online scams and bad (toxic) behaviour - Avoids cyberbullying - Shows empathy (care and kindness) for others online

Long Question: Discuss the importance of being a safe and responsible digital citizen. *(Exercise – Detail Q2)*

1. **Why it is important:** We spend most of our time online, and we store most of our things there too. So it's very important to protect our devices and information from harmful people.
2. **Danger of being unsafe:** If we leave devices unprotected, the result can be small, like a slower computer — or it can be very big, like losing all the money in a bank account, or identity theft.
3. **A good digital citizen:** encourages positive and healthy talk online, knows about common online scams and toxic behaviour, avoids cyberbullying, and shows empathy for others online.

4. **Characteristics of all good digital citizens:** They protect private information for themselves and others, respect themselves and others, and stay safe online. They also stand up to cyberbullying, balance the time they spend online, and respect copyright and intellectual property (other people's creative work, like songs or books) — and they carefully manage their digital footprint (the trail of information they leave behind online).

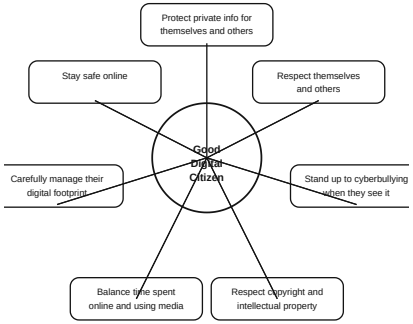

Fig: Characteristics of a good digital citizen

Responsible digital citizenship

Long Question: What do you mean by a responsible digital citizen? *(Exercise – Detail Q8)*

1. **Responsible digital citizenship:** We must understand what happens when we post photos, videos, or other personal content — once something is online, it's very hard to remove, and it can become part of our permanent online reputation (how people see us). Photos can also be changed or shared without our permission.
2. **Respectful digital citizen:** Respect for ourselves and others matters in every relationship, and it's the same online. We should treat online friends with as much respect as face-to-face friends, and never create or forward nasty or humiliating emails, pictures, or messages about anyone.
3. **Online social skills:** A responsible digital citizen has the online social skills to take part in online community life in an ethical and respectful way.
4. **Properties of a good digital citizen:**

- Respect the rights of others.
- Practise tolerance (accept people who are different from you).
- Be informed about the world around you.
- Respect the property of others.
- Be compassionate (kind).
- Take responsibility for your actions.
- Pay taxes.

Extra Bit: If you get nasty or bullying comments, block or unfriend the people who do not treat you with respect.

Protecting your online reputation

Long Question: How can we protect our reputation online? *(Exercise – Detail Q3)*

Being a responsible digital citizen means having the online social skills to take part in online community life in an ethical and respectful way. To protect our reputation, we should:

1. **Behave lawfully:** Follow the law when we are online.
2. **Protect privacy:** Protect our own privacy and the privacy of others.
3. **Know our rights and responsibilities:** Learn our rights and responsibilities when we use digital media.
4. **Think before acting:** Think about how our online activities affect ourselves, people we know, and the wider online community.
5. **Post carefully:** Think before posting photos and videos. Once they are online, they are hard to remove. They become part of our permanent online reputation.

Protect your privacy

Here are ways to protect your privacy online: 1. Share only as much personal information as necessary. 2. Keep privacy settings up to date on social media sites. This way, your profile is not open to everyone. 3. Keep your passwords private. 4. Check the location settings and services on smartphones, tablets, and apps.

Watch out for scams

Cybercriminals (criminals who use computers and the internet) can trick, or **scam**, people online in many ways. Most scams can be avoided if you have the right knowledge and tools. Here are three common scams:

1. **Phishing:** A scammer sends a malicious (harmful) link. The link is made to trick a person into giving away sensitive (private) information, like a password. The attacker can then watch everything the victim does on the site, and even get past extra security steps.
2. **Fake websites:** These are common with shopping websites. Cybercriminals make a fake site to trick you into entering your personal information. Then they misuse it.
3. **Tech support scams:** Fake “tech support” agents ask for your login information or remote access to your computer. Then they ask you for money to “fix” it.

Long Question: How can we say that tech support scams are harmful? *(Exercise – Detail Q7)*

1. **Fake agents:** In a tech support scam, a person pretends to be a computer expert. Often a fake warning appears on the screen, such as: “System may have detected viruses on your computer. Call tech support right away.”
2. **Stealing information:** The fake agent asks for our login information — username and password — and with that, he can open our accounts.
3. **Remote access:** He asks for remote access to our computer, so he can see our files, steal our data, or install harmful software.
4. **Asking for money:** After that, he asks for money to “fix” the computer. This is a red flag (warning sign). A real tech support agent would not usually ask for payment like this.

✦

Conclusion: Tech support scams are harmful because we can lose our private data, our money, and the safety of our computer. We should never give passwords or remote access to strangers.

TOPIC 3: USES OF THE INTERNET

Using the internet in a good way makes our lives easy and simple, because it gives us useful data, information, and knowledge — and this helps us grow personally, socially, and economically (in terms of money and work).

Use of internet in business (5.3.1)

The internet has become a very important part of business — businesses now use it for much more than just email and a basic website. Common uses are:

1. **E-commerce (5.3.2):** E-commerce means buying and selling things online, and according to the U.S. Census Bureau, it made up 14 percent of all retail sales in 2020. Government services are available online too now, and businesses like Amazon and Shopify stores do all their selling and customer dealing on the internet.
2. **Marketing and CRM (5.3.3): CRM** stands for **Client Relationship Management** — software that uses a lot of data to help businesses serve customers better, sell more, and find new customers. CRM analytics lets a business treat each customer in a personal way, instead of treating everyone the same. Tools like Facebook Pixel, for instance, can find new customers by looking at the websites they visit, the posts they like, and the videos they watch on YouTube.
3. **Collaboration and document storage (5.3.4):** Tools like Google Drive, Microsoft OneDrive, and Dropbox let people work together on projects in real time, from anywhere — updating, editing, and commenting on documents, while the person who made the file controls who can see and edit it.
4. **Videoconferencing, chat, and remote employees (5.3.5):** Many businesses let people work from home now — this is called remote work, and it saves the cost of having a big office. They use video calls, chat apps, and social media to keep their teams together, while automated chatbots on websites answer customer questions quickly, without a person waiting online.

CRM: from leads to customers (from the book's figure) — the stages are: - Raw Leads → Viable Leads → Nurtured Leads → Active Leads (these four stages are handled by **Marketing Automation**) - Marketing Qualified Leads → Sales Accepted Leads → Opportunities → Closed/Won (these four stages are handled by **CRM**)

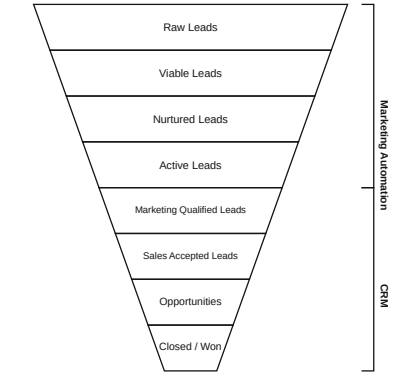

Fig: CRM — from raw leads to closed customers

Use of internet in social networking (5.3.6)

Social networking means using internet-based social media sites to stay connected with friends, family, colleagues, or customers — it can serve a social purpose, a business purpose, or both. Examples are Facebook, Twitter, Instagram, and Pinterest. In short, social networking means building and keeping personal and business relationships using technology.

Use of internet in entertainment (5.3.7)

We can enjoy a lot of content on the internet, through our phone, TV, or computer. Popular free online entertainment includes: - YouTube videos - Podcasts (audio shows you can listen to online) - Music streaming, such as Pandora or Spotify - News sites, such as ARY, Geo, Bol News, Dunia News, and National Public Radio - Game sites, such as King.com and Miniclip

TOPIC 4: COPYRIGHT, PLAGIARISM AND PIRACY

We must respect the work of other people — copying it without permission is wrong, and it can even be a crime.

Copyright (5.4)

Copyright is a type of **intellectual property right** — intellectual property being something a person creates with their mind, like a song, a book, or an invention. Copyright protects the original work of its owner.

Under copyright law, protected works include: paintings, photographs, illustrations, musical compositions, sound recordings, computer programs, books, poems, blog posts, movies, architectural works, and plays.

Plagiarism (5.5)

Plagiarism means presenting someone else's work or ideas as your own — and it doesn't matter if you had their permission or not, it's still plagiarism. This covers all published and unpublished material, whether electronic or printed. Plagiarism counts as academic dishonesty (cheating in schoolwork), and it's a disciplinary offence (a punishable act).

Types of plagiarism: 1. **Global plagiarism:** Copying a whole text. 2. **Paraphrasing plagiarism:** Rewriting someone else's ideas in new words and presenting them as your own thoughts. 3. **Patchwork plagiarism:** Copying phrases and ideas from different sources and joining them into a new text. 4. **Self-plagiarism:** Using your own old work again, when you have already submitted or published it before.

Piracy (5.6)

Piracy means illegally copying copyrighted material, such as books, computer programs, and films. It's a criminal act, aimed at stealing other people's ideas and inventions.

Difference between piracy and plagiarism:

Plagiarism	Piracy
Showing someone else's work or ideas as your own	Illegally copying, using, or selling copyrighted material
The person takes credit for another person's work	The person copies the work without permission or payment
It is academic dishonesty and a disciplinary offence	It is a crime (a criminal act)
Example: copying an essay from the internet and putting your own name on it	Example: copying a movie or software and selling it

TOPIC 5: DIGITAL MEDIA BIAS

Media bias happens when a news channel lets its own opinions affect the news it reports.

Digital media bias (5.7)

Media criticism means examining and studying the messages in mass media (TV, newspapers, websites, and so on). A media channel may show **bias** (unfairness, favouring one side) in how it reports a news story — or in which stories it even chooses to cover, because it thinks some are more important than others.

Types of media bias: 1. Slant Bias 2. Spin Bias 3. Sensationalism Bias (making news sound more exciting or scary than it really is) 4. Story Choice Bias (choosing to cover some stories and not others) 5. Word Choice Bias 6. Omission Bias (leaving out important information)

Long Question: Discuss the impacts of media bias. *(Exercise – Detail Q6)*

1. **One-sided news:** Media bias shows up in which news stories get chosen, and how they're covered — so people end up getting only one side of the story.
2. **Wrong opinions:** When a news channel lets its opinions affect the news, people may form wrong opinions about people, groups, or events.
3. **Hidden information:** Because of omission bias and story choice bias, some important news is not shown at all.
4. **Exaggeration:** Sensationalism bias makes small news look much bigger and more exciting than it is, which can create fear or anger in people.
5. **Hiding criticism:** Calling a media source "unbiased" can also be a trick to hide bias, or to stop criticism, debate, and discussion.

✦

Importance of unbiased media (5.8)

Unbiased news is a good thing — news channels should try to give a balanced view, collecting views from all sides of politics, understanding different worldviews, and avoiding media bias.

Unbiased news fairly shows many points of view on topics where people disagree. Biased news from one side (such as a conservative view) is still part of the media, and that's fine, as long as the channel is open and honest about its bias.

Long Question: How can we avoid media bias? *(Exercise – Detail Q4)*

We can do these things to avoid the problems of media bias: 1. Give the reader multiple views on news and issues. 2. Strengthen our media literacy skills (our ability to understand and judge media). 3. Try to get all sides of an issue. 4. Watch different news channels that have different views. 5. Remember: if it sounds too good to be true, it probably is not true. 6. Read the footnotes and small warnings (caveats) in advertisements or promotions.

TOPIC 6: MISUSE OF COMPUTER RESOURCES AND ONLINE PRIVACY

Computer resources must be used the right way. We must also keep our personal information private and safe.

Misuse of computer resources (5.9)

Misuse of computer resources is not just about physical misuse. It also includes:

Long Question: List the misuse of computer resources. *(Exercise – Detail Q5)*

1. **Unauthorized access:** Using computers, computer software, computer data, or networks without permission.

2. **Improper use:** Using computer resources for a purpose other than the one they were allowed for.
3. **Illegal use:** Breaking (violating) any software licence or copyright.
4. **Interfering with others:** Harassing or threatening other users, or disturbing their access to computing facilities.
5. **Improper alteration of system files:** Changing accounting system files or audit trails without permission, in order to change or delete records.

✦

Securing information privacy and confidentiality (5.10)

- **Privacy** is a person's right to control how their personal information is collected, used, and shared.
- **Confidentiality** means how much information can be kept secret.

Not knowing how to protect our personal information online can cost us a lot — it can cause stress, or worse, if the wrong people get hold of our personal data.

Important tips to protect your privacy:

1. **Pick strong and unique passwords:** Do not use easy passwords linked to your personal life. Mix capital letters, numbers, and symbols. Use a different password for each account.
2. **Use a VPN:** A **VPN (Virtual Private Network)** adds an extra layer of privacy by encrypting (scrambling and protecting) the data that leaves your computer, and sending it through other (third-party) servers.
3. **Avoid clicking links and attachments in emails:** Phishing emails often tell sad stories, or have strange links, to trick you into giving your details — so scan any attachment with anti-malware software first.
4. **Log out of websites properly:** If you don't log out, you leave the door open for others to use your account — it's like leaving your wallet in a shop. If a laptop with automatic logins is stolen, the thief can easily see your private data, so use a password manager instead of auto logins.
5. **Use your browser's incognito mode:** In this mode, the next person can't see your browsing history, and it also deletes cookies and temporary files that track what you do online.
6. **Keep your anti-malware up to date:** Trojan horses and worms (types of harmful software) can infect a computer and send everything you type to criminals — updated anti-malware software stops them.
7. **Be careful what you share online:** Instagram and Twitter are hotspots for phishers and cybercriminals. Do not publicly share your identity, your location, or your date of birth.

TOPIC 7: POSSIBLE DANGERS OF THE INTERNET (5.11)

The internet is a great place to find information, but it is also full of dangers. Many users do not even notice these dangers.

1. **Depression and anxiety:** Spending too much time on social networking sites can badly affect your mood. People who use social media too much are more likely to have poor mental health, including anxiety and depression.
2. **Cyberbullying:** Bullying people using electronic means is called cyberbullying, also known as online bullying — and it's common among teenagers. *Example:* when someone bullies or harasses others on the internet, especially on social media.
3. **FOMO (Fear of Missing Out):** FOMO became common with the rise of social media, and it's one of the most common bad effects of it. People keep posting online because they're afraid others will think their life is boring or not important.
4. **Unrealistic expectations:** Social media creates false expectations about life and friendship in our minds, because most of it lacks authenticity (being real and true) — people share only exciting adventures and heavily staged (posed) photos.

5. **Unhealthy sleep patterns:** Spending too much time on social media can cause poor sleep, and if it becomes irregular and your work starts to suffer, you should cut back on the time you spend on social media. (Sleep happens in stages — Non-REM stages 1, 2, and 3, and then REM sleep.)

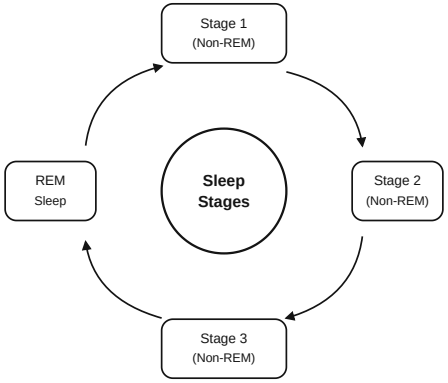

Fig: Sleep stages cycle (recreated and corrected from the book's Fig. 5.16 — see "Mistakes Found in the Book" below)

SHORT QUESTIONS — UNIT 5

1. **Define ethics.** *[Topic 1 · Exercise]*
   Ethics is the study of what is morally good and bad, or right and wrong.
2. **Justify that plagiarism is an offence.** *[Topic 4 · Exercise]*
   Plagiarism means showing someone else's work or ideas as your own. This is cheating, and it is academic dishonesty. So it is a disciplinary offence (a punishable act).
3. **Define phishing in your own words.** *[Topic 2 · Exercise]*
   In phishing, a scammer sends a harmful link. It is made to trick a person into giving away sensitive information, like passwords or bank details.
4. **List the issues of digital ethics.** *[Topic 2 · Exercise]*
   Misuse of personal information, misinformation and deep fakes, lack of oversight and responsibility, and social and political instability.
5. **Discuss any three uses of the internet in business.** *[Topic 3 · Exercise]*
   E-commerce (selling things online, like Amazon), marketing and CRM (serving customers better), and collaboration and document storage (using tools like Google Drive, OneDrive, and Dropbox).
6. **Define CRM.** *[Topic 3 · Exercise]*
   CRM (Client Relationship Management) is software that uses data to help businesses serve customers better, sell more, and find new customers.
7. **Discuss the use of the internet in entertainment.** *[Topic 3 · Exercise]*
   We enjoy YouTube videos, podcasts, music streaming (like Spotify), news sites (like ARY and Geo), and game sites (like Miniclip) on our phone, TV, or computer.
8. **Define copyright in your own words.** *[Topic 4 · Exercise]*
   Copyright is a legal right that protects the original work of its owner, like books, songs, movies, and computer programs.
9. **Differentiate between piracy and plagiarism.** *[Topic 4 · Exercise]*
   Plagiarism means showing someone else's work as your own. Piracy means illegally copying copyrighted material, like books, software, and films.

10. **What is an ethical issue?** *[Topic 1]*
    It is a situation where a moral problem comes up in society or at work.
11. **What is digital ethics?** *[Topic 2]*
    Knowing and following the rules of good behaviour while online is called digital ethics.
12. **What is a fake website scam?** *[Topic 2]*
    Cybercriminals make a fake website, usually a shopping site, to get our personal information and misuse it.
13. **What is social networking?** *[Topic 3]*
    It is the use of internet-based social media sites to stay connected with friends, family, colleagues, or customers.

MULTIPLE CHOICE QUESTIONS — UNIT 5

These are the book's own Exercise MCQs plus a few extra practice MCQs, with the correct answer marked ✔ above the option.

1. The ways of online communication involve: *[Topic 2]*

   a) Social media | b) Messengers | c) Chats | ✔ **d) All of these**

2. Leaving your devices unprotected can result in: *[Topic 2]*

   ✔ **a) Slow down your computer** | b) Gain money | c) Fast your computer | d) All of these

3. In _____, a scammer sends you a malicious link, designed to trick a person into revealing sensitive information. *[Topic 2]*

   a) Fake Websites | b) Tech Support | ✔ **c) Phishing** | d) None

4. Fake _____ agents will often ask for login information or remote access to your computer. *[Topic 2]*

   a) Fake Websites | ✔ **b) Tech Support** | c) Phishing | d) None

5. Which of the following is NOT a use of the internet? *[Topic 3]*

   a) E-commerce | b) CRM | ✔ **c) SRM** | d) All of these

6. CRM stands for: *[Topic 3]*

   a) Client Relationship Model | b) Customer Relation Module | ✔ **c) Client Relationship Management** | d) Client Relation Module

7. The term _____ refers to the use of internet-based social media sites. *[Topic 3]*

   ✔ **a) Social networking** | b) Media networking | c) Social websiting | d) Websiting

8. _____ is a type of intellectual property right that protects the original work of an owner. *[Topic 4]*

   a) Cyberbullying | b) Plagiarism | c) Piracy | ✔ **d) Copyright**

9. Illegally reproducing copyrighted material, such as books, computer programs, and films, is called: *[Topic 4]*

   a) Cyberbullying | ✔ **b) Plagiarism** | c) Piracy | d) Copyright

10. Accessing computers, computer software, computer data, or networks without authorization is called: *[Topic 6]*

    ✔ **a) Unauthorized access** | b) Illegal use | c) Authorized access | d) Improper experiments

11. Ethics deals with what is morally: *[Topic 1]*

    a) Fast and slow | ✔ **b) Right and wrong** | c) Big and small | d) Old and new

12. Aristotle called ethics the science of: *[Topic 1]*

a) Computers	**b) Proper behaviour** ✔	c) Numbers	d) Nature

13. Knowing and following the rules of being online is called: *[Topic 2]*

a) Media bias	**b) Digital ethics** ✔	c) Piracy	d) Phishing

14. Which of these is a digital ethical issue? *[Topic 2]*

a) 5G	**b) Deep fakes** ✔	c) Robots	d) Smart devices

Mistakes Found in the Book

1. **Page 110, Answer key, Unit 5 MCQ 9:** The answer key gives (b) plagiarism. But the book itself (page 87) defines “illegally reproducing copyrighted material, such as books, computer programs, and films” as **piracy**, not plagiarism. So the correct answer should be (c) piracy. (For your exam, write the official key’s answer, b, if your teacher follows the official answer key — but remember the book’s own text says the correct meaning is piracy.)
2. **Page 93, MCQ 2:** The book letters the four options wrongly as a, c, b, c (two options are both labelled “c”). The correct answer is the first option, “Slow down your computer.”
3. **Page 88:** The book writes “SAO (Service Oriented Architecture),” but the correct short form for this term is **SOA**, not SAO. The same line also calls interfering with others’ computing access “(that’s piracy)” — which is incorrect, since interfering with or harassing other users is a type of misuse and harassment, not piracy. Piracy means illegally copying copyrighted material.
4. **Page 87:** The book’s definition of piracy says it is “an act of criminal violence.” This wording is incorrect — piracy is a type of theft or copying crime, not an act of violence. The correct description is that piracy is a **criminal act**, with the goal of stealing other people’s ideas and inventions.
5. **Page 91, Figure 5.16 (Sleep Stages):** The sleep stages picture shows “Stage 4” two times (once as REM, once as Non-REM). The four stages should be numbered 1, 2, 3, and 4, with REM sleep coming after them, not relabelled as Stage 4 twice.
6. **Page 86, Uses of internet in entertainment:** The book lists a news channel as “Dunia News.” The well-known Pakistani news channel is actually spelled “Dunya News.” This looks like a small spelling mistake in the book.
7. **Page 85:** The book uses the full form “Client Relationship Management” for CRM. Many other books call CRM “Customer Relationship Management” instead. For this book’s exam, write **Client Relationship Management**, since that is what this textbook teaches.

Unit 6 — Entrepreneurship in Digital Age

TOPIC 1: BUSINESS PLAN

A **business plan** is a written paper that tells people how a business will run — and it's one of the most important steps before starting a successful business. It doesn't matter who runs the business: - one person (a **sole trader**), - two or more people together (a **partnership**), or - a **limited company** (a bigger business owned by shareholders).

What is a business plan? (6.1, 6.1.1)

- A business plan is an important written document.
- It gives a full, clear picture of where the company is headed.
- Every business should have one, no matter its size.
- It lays out the business strategy — the big plan — along with the main goals.
- It shows where the business stands now, and where it wants to go next.
- It can also help an older, already-running company that wants to try a new direction.
- And it works like a **benchmark** — a standard we use to check something, here, how well the company is doing.

The main areas covered in a business plan are: goals, marketing, competitors, finance, strategy, timeline, operations and team.

Key sections of a business plan

A business plan has 7 key sections: 1. An executive summary 2. A business description 3. Details of market strategies 4. Competitor analysis 5. A design and development plan of products and services 6. Information about operations and management 7. Financial information, planning and factors

Long Question: Write a note on the key components of a business plan. [Exercise Brief Q8]

1. **Executive Summary**: This is a short overview of the whole plan — it might include a table of contents, company background, market opportunity, management overview, competitive advantages, and financial highlights.
2. **Business Description and Structure**: This explains why the business exists and what it sells, and talks about how things are made — where the materials come from, how stock (inventory) is handled, and how delivery works. If the business sells a service instead, it explains the service and its value to customers, and it also covers legal matters, office details, and expenses.
3. **Competitor Analysis**: Before starting a business, we need to study our competitors — other businesses selling similar things — because this research helps us plan correctly for demand (what people want) and supply (what we can give).
4. **Development Plan of Products**: This shows how the plan actually gets carried out: the product or service is made by following clear steps, with quality checks along the way.
5. **Market Research and Strategies**: This covers the market study and the marketing plan — sales forecasts, deadlines, milestones, advertising, and public relations — and it's how a business beats its competition. When there isn't much data to work with, the business can use **testimonials** (good comments from real customers) instead.
6. **Management and Personnel**: This gives short life stories (bios) of the company's managers, explaining how their skills help meet business goals. Since investors check risk before giving money, an experienced team helps them feel safer.
7. **Financial Documents**: This gives the numbers behind the whole plan, including the profit and loss statement, balance sheet, and cash flow statement — planned out for the next three years.

Long Question: What is the use of a business plan in the ideology of developing a business? [Exercise Brief Q9]

1. **Clear picture**: A business plan is a written document that gives a full, clear picture of the company's future.
2. **Goals and strategy**: It explains the business strategy and the main goals — from where the business is now to where it wants to be.
3. **Guide for work**: It works like a road map — the development plan shows how the product will be made, while the operations plan shows how the business will run day to day.
4. **Getting money**: Investors — people who put money into a business — read the plan and its financial documents to help them decide whether to invest.
5. **New direction**: It's also useful for an older company looking to change direction.
6. **Benchmark**: It also acts like a standard, checking whether the company is doing well.

Long Question: Why is market research important when planning to set up a business? [Exercise Brief Q10]

1. **Knowing the competitors**: Before starting a business, we need to research our competitors — this tells us what they sell, at what price, and how.
2. **Demand and supply**: Thorough research helps us plan correctly for the demand and supply of our product or service.
3. **Marketing strategy**: Market research helps us plan sales forecasts, deadlines, milestones, advertising, and public relations.
4. **Beating competition**: This is how a business competes well and builds a successful business plan.
5. **Building trust**: And if we don't have much data, we can show testimonials from real customers instead.

Conclusion: Without market research, a business might end up making something people don't need, or setting the wrong price — so, in short, market research lowers risk.

TOPIC 2: PROMOTION, VALUE PROPOSITION AND QUALITY ASSURANCE

These three ideas help a company sell its products and keep its customers happy.

Promotion (6.2)

Promotion means all the activities that tell people about a product, brand, or service — the goal is to make them aware of it, attract them, and make them want to buy it instead of going to someone else.

1. **Types of promotion**: Advertisements, press releases, and consumer promotions (schemes, discounts, and contests).
2. **Below the line promotions**: Trade discounts, freebies (free gifts), incentive trips, awards, and similar things.
3. So sales promotion is really just one part of the whole promotion effort.

Value proposition (6.3)

A **value proposition** is a short, clear statement that tells customers the benefits they'll get by buying the company's products or services — it works like a promise, both inside the company and out in the market.

Do you know? The term “value proposition” first appeared in a McKinsey & Co. research paper in 1988. It was defined as: “a clear, simple statement of the benefits, both tangible (things you can touch) and intangible (things you cannot touch), that the company will provide, along with the approximate price it will charge each customer segment for those benefits.”

Quality assurance (6.4)

Quality assurance (QA) is a process that helps a business follow the quality standards set by the company or its industry — in simple words, it’s how a company works to improve the quality of its products.

1. **A promise**: Many businesses see QA as a promise to their stakeholders (people connected to the business) and customers — a promise to deliver high-quality products and a good experience.
2. **A broad process**: QA stops quality problems before they even happen, since the QA team checks every stage — production, testing, packaging, and delivery.
3. **Quality control (QC)**: This is a narrower process than QA — QC looks for mistakes, errors, or missing things in the finished product.

The quality assurance cycle (from the book’s diagram) has 5 steps that repeat in a circle: 1. Identify issues with the process. 2. Generate (create) corrective actions — ways to fix the problem. 3. Verify the corrective action — check that the fix works. 4. Implement the corrective action — actually apply the fix. 5. Monitor and control — keep watching so the problem does not come back.

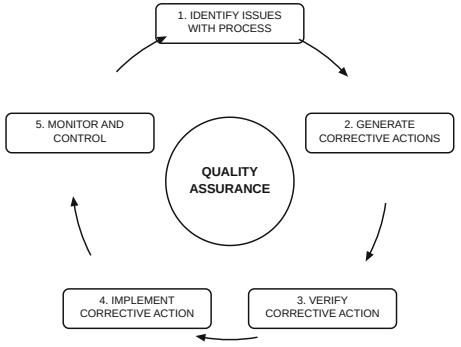

Fig: The Quality Assurance cycle — 5 steps repeating in a circle

TOPIC 3: PROJECT MANAGEMENT AND MEDIA LITERACY

Project management helps a business finish its work on time, while media literacy helps people understand the messages they see in the media.

Importance of project management and media literacy (6.5)

Handling a project can be hard — it takes a good understanding of scheduling, planning, reporting, and tracking. So a good project manager needs to understand project management well, along with its different job roles.

1. **Project Management**: The Project Management Institute defines it as: “Project management is the application of skills, knowledge, tools and techniques to project activities to meet project requirements.” It uses policies, principles and procedures to guide a project from start to finish, giving leadership and direction to the whole thing.

2. **Media Literacy**: Media literacy helps people understand and take part in public discussions, and make good decisions when choosing their leaders — because a media-literate person can think carefully and critically about media messages.

Long Question: How does project management help in developing a business plan? [Exercise Brief Q7]

1. **Meaning**: Project management uses skills, knowledge, tools and techniques to finish project tasks and meet project requirements.
2. **Planning and scheduling**: A business plan has many tasks — market research, product development, finance — and project management plans and schedules all of them.
3. **Reporting and tracking**: It also tracks progress and makes reports, so that deadlines and milestones in the business plan are actually met.
4. **Start to finish**: It uses policies, principles and procedures to guide the work from the very first stage to completion.
5. **Leadership**: It gives leadership and direction to the team, so everyone knows their job.
6. **Media literacy helps too**: It helps the business understand media messages and public opinion while planning its marketing.

✦

TOPIC 4: PAYMENTS AND TRANSACTIONS

Payments and transactions happen in every business. They are related ideas, but they are not the same thing.

Payments (6.6)

A **payment** is when someone freely gives money — or something of equal value — to another person, in exchange for goods or services, or to complete a legal duty.

1. **Payer**: The person who gives the money.
2. **Payee**: The person who gets the money.
3. **Ways to pay**: Cash, cheque, wire transfer, credit card, debit card, or even crypto currency (digital money like Bitcoin).

Transactions (6.7)

A **transaction** is a complete agreement between a buyer and a seller, where they exchange goods, services, or financial assets (things of money value) for money. The same word is also used in company accounting (keeping financial records).

Difference between payments and transactions (6.7.1)

Long Question: Elaborate the difference between a transaction and a payment. [Exercise Brief Q1]

Payment	Transaction
It is the transfer of value (money or goods) from one party to another.	It is a complete agreement between a buyer and a seller.
It is given for goods or services, or to complete a legal duty.	It is made to exchange goods, services or financial assets for money.
It can take many forms: cash, cheque, card, wire transfer, crypto currency.	It is one single instance of buying or selling something.
Barter (exchanging one good or service for another) is also a form of payment.	In accounting, events that affect a business's money are recorded as accounting transactions.
It involves a payer (who gives) and a payee (who gets).	It involves a buyer and a seller.

Example: When you buy a book from a shop, the whole deal is a transaction. The money you give the shopkeeper is the payment.

TOPIC 5: DIGITAL MARKETING

Digital marketing means using the internet and digital tools to promote a product — it helps companies sell more and build a better brand image (the way people see the company), and has become a key business skill over the last ten years, as technology has grown in importance.

Tools and techniques used in digital marketing (6.8)

Long Question: Write a note on the tools and techniques used in digital marketing. [Exercise Brief Q2]

There are 9 digital marketing techniques:

1. **Social Media Marketing**: Having a strong presence on social media is the most important digital marketing tool today — it's now a must-have technique for growing a brand digitally.
2. **Search Engine Optimization (SEO)**: This brings more visitors (traffic) to a website by making it appear higher in search results on engines like Google, which also improves brand awareness.
3. **Email Marketing**: This brings customers back to buy new products — people sign up for an email list, often after their first purchase, which builds customer loyalty (keeping customers coming back) and a good relationship with them.
4. **Content Marketing**: This means creating useful, valuable content regularly across different platforms, which helps build brand awareness.
5. **Video Marketing**: This works alongside content marketing — good-quality videos leave a long-lasting image of the brand in people's minds.
6. **Web Advertising**: Brands create clickable advertisements and place them on popular websites.
7. **Affiliate Advertising**: A brand pays a popular person with many followers, usually a blogger or social media influencer, to post about the company.
8. **Overall Personalization**: Giving a brand its own unique style makes people believe the company is successful.
9. **Creating an App**: An app gives customers an easy way to contact the brand, shows them where to buy things, and sends notifications about new products.

How affiliate marketing works (from the book's diagram): 1. The advertiser partners with a publisher (like a blogger or influencer). 2. The publisher promotes the product to the customer. 3. The customer buys from the publisher's recommendation. 4. The advertiser pays the publisher.

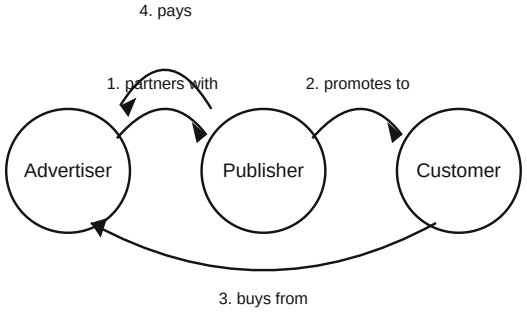

Fig: How affiliate marketing works

Long Question: What role does digital marketing play in today's world? [Exercise Brief Q3]

1. **Technology in business**: Over the last ten years, technology has become very important in the business world.

2. **More sales**: Digital marketing helps companies improve sales through social media, websites, emails and apps.
3. **Brand image**: It helps build a strong brand image, for example through content marketing and video marketing.
4. **Reaching more people**: Using SEO, web advertising and affiliate advertising, a business can reach many people at a low cost.
5. **Keeping customers**: Email marketing and apps bring customers back and keep them updated on new products, which builds loyalty.
6. **Two-way talk**: Customers can talk to the brand easily, and the brand can treat each customer in a personal way.

✦

TOPIC 6: SEARCH ENGINE OPTIMIZATION AND SOCIAL MEDIA

SEO stands for Search Engine Optimization — the process of improving a website so it's easier to find in search results.

Search engine optimization (6.9)

SEO increases how easily people can find a website when they search for products or services on Google, Bing, and other search engines. The easier it is to find a website, the more likely it is to attract new and existing customers.

Long Question: How does search engine optimization help the business grow? [Exercise Brief Q4]

1. **Better visibility**: SEO improves a website so it appears higher in search results on Google, Bing, and other search engines.
2. **More customers**: Better visibility means more attention for the business, attracting both new (prospective) and existing customers.
3. **Huge number of searches**: People search online trillions of times every year, often to find products and services they want to buy.
4. **Main source of traffic**: Search is often the main way people find a brand online, and it also supports other marketing methods.
5. **Beating competitors**: Ranking higher than competitors in search results has a big effect on the business's profit.
6. **Brand awareness**: SEO also helps more people become aware of the brand.

✦

The SEO Pyramid (from the book's diagram): It has 4 levels. We should start with a strong base at the bottom and build up: 1. **Accessible, quality content** (the base — build this first): unique text content, content that search engine "bots" can read, a clear URL structure, internal links, sitemaps, and working server response codes. 2. **Keyword research and targeting**: finding and choosing the right keywords, and placing them well in titles, meta tags, URLs, and headings (H1s). 3. **Link building**: asking for links and creating content that naturally earns links from other websites. 4. **Social** (the top level): getting users to engage on the site, and using social media and viral marketing (content that spreads quickly online).

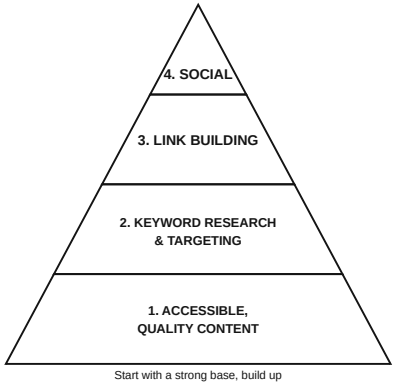

Fig: The SEO Pyramid — 4 levels, base to top

Twitter (6.9.1)

1. Twitter actually came from a podcasting company called Odeo, started in 2004 by Evan Williams, Biz Stone and Noah Glass.
2. In 2005, Apple added podcasts to iTunes. Because of this, Odeo needed a new direction.
3. Engineer Jack Dorsey suggested a short message service (SMS) so friends could share small, blog-like updates, and Glass suggested the name "Twttr".
4. Dorsey sent the first tweet ("just setting up my twttr") on March 21, 2006. The full version of Twitter started in July 2006.
5. In October 2006, Williams, Stone and Dorsey bought Odeo and started a new company called Obvious Corp.

Snapchat (6.9.2)

1. Evan Spiegel and Bobby Murphy met at Stanford University, and in spring 2011, they made Picaboo, the first version of Snapchat.
2. It was an app that sent photos which disappeared after a short time, and it launched on the iOS App Store in July.
3. Users found they could take screenshots, which made the disappearing photos pointless. So the creators added a notification that tells you when someone takes a screenshot.
4. In September, they renamed the app Snapchat, added captions to photos, and launched it again — focusing more on improving the technology than on advertising.

Blogs (6.9.3)

A **blog** (short for "weblog") is an online journal or information website that shows posts in reverse order by time, so the newest one appears first, at the top. A writer, or a group of writers, uses it to share their views with people all over the world.

TOPIC 7: TECHNOLOGY AND DIGITAL PLATFORMS FOR ENTREPRENEURSHIP

An **entrepreneur** is a person who starts and runs a new business, and **entrepreneurship** is the work of starting and growing one, often by trying out a new idea. Technology plays a very important role today in helping entrepreneurship grow.

Technology as an enabler in entrepreneurship (6.10)

Entrepreneur enabling means working with and supporting people who want to start businesses, and **entrepreneurship enablers** are the things that make it possible for them to start and grow — technology being one of the biggest.

- Technology improves **infrastructure** (basic systems like the internet and payment systems) and business culture.
- **ICT** (Information and Communication Technology) acts as an **enabler**: it gives entrepreneurs new opportunities, but it can also create some limits (constraints).
- ICT also acts as an **implementer**: it gives modelling tools and systems engineering to help build new business processes.
- Together, ICT as an enabler and ICT as an implementer create a **new business process**.
- Old businesses are becoming digital, and brand-new digital businesses are being created — together, this is called **digital entrepreneurship**, and it brings innovation and helps the economy grow.
- Digital platforms like Facebook, Instagram, Amazon, and PayPal let people sell, market, and receive payments easily.

From the book's diagram: Digital Technology sits where three circles overlap — **Digital Enabler**, **Digital Outcome**, and **Digital Context**. This shows that digital technology connects what makes a business possible (enabler), what the business achieves (outcome), and the situation around the business (context).

Long Question: How does technology promote entrepreneurship in the economy? [Exercise Brief Q5]

1. **Enablers**: Entrepreneurship enablers are things that make it possible for entrepreneurs to start and grow, and technology is one of the biggest.
2. **Infrastructure and culture**: Technology improves infrastructure (like the internet and payment systems) and business culture.
3. **ICT as an enabler**: ICT gives opportunities to entrepreneurs, but it can also create some limits.
4. **ICT as an implementer**: ICT gives modelling tools and systems engineering to build new business processes.
5. **Digital entrepreneurship**: Old businesses are becoming digital, and new digital businesses are being created — bringing innovation and economic growth.
6. **Digital platforms**: Platforms like Facebook, Instagram, Amazon, and PayPal let people sell, market, and receive payments easily.

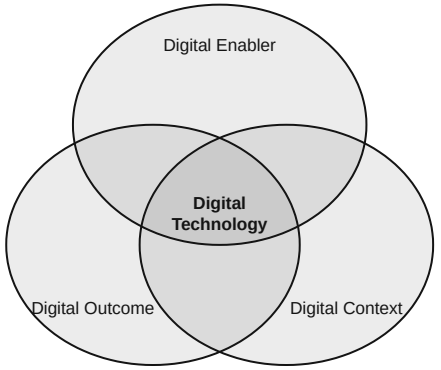

Fig: Digital Enabler, Digital Outcome and Digital Context overlap into Digital Technology

✦

Digital platforms used for entrepreneurship (6.11)

Entrepreneurship is a main driving force behind innovation and economic growth, and digital entrepreneurship is rising fast — this happens in two ways: old businesses going digital, and brand-new digital businesses being created.

A **Digital Business Platform** is a way to combine different technologies to create new business abilities in creative ways, creating a logical layer that separates the business plan from the technology running behind it.

Long Question: State and explain the types of digital platforms used for entrepreneurship. [Exercise Brief Q6]

Digital platforms exist at many levels — some are high-level platforms that support a whole business model, while others are low-level, giving business or technology abilities to other products. The most common ones are:

1. **Social media and media-sharing platforms**: These let people share posts, photos, and videos. Examples: Instagram and YouTube.
2. **Knowledge platforms**: People ask questions and share knowledge here. Examples: Quora and Reddit.
3. **Service-oriented platforms**: These connect people who offer a service with people who need it. Example: Airbnb.

4. **E-commerce platforms**: These are used to buy and sell goods online. Example: Alibaba.

Types of platform business models (from the book's chart):

Platform type	Examples
Social Media	Facebook, LinkedIn, Twitter
Communication	WhatsApp, Skype, WeChat, LINE
Search	Google, Bing, Yahoo, Safari
Sharing Economy	Airbnb, Uber (peer-to-peer), ZipCar; file and music sharing
Matching	TaskRabbit, Tinder, e-Harmony
Development	App stores, gaming consoles
Content and Review	YouTube, TripAdvisor, Yelp
Booking Aggregators	Booking.com, Expedia, Agoda
Retail	Amazon, Etsy, eBay, Craigslist
Payment	PayPal, Alipay, Visa
Crowdsourcing and Crowdfunding	InnoCentive, Kickstarter

A **sharing economy platform** lets people share things instead of buying new ones. The book explains four kinds: 1. Sharing of limited assets and resources, like cars and bicycles. 2. Peer-to-peer sharing (person to person), like Airbnb and Uber. 3. Sharing of assets the platform owner provides, like ZipCar. 4. Sharing of resources that are not limited, like files, music, and information. This is mostly peer-to-peer.

Crowdfunding means raising small amounts of money from many people, usually online, to fund a new idea or project. InnoCentive and Kickstarter are examples of crowdsourcing and crowdfunding platforms.

SHORT QUESTIONS — UNIT 6

1. **Elaborate the difference between a transaction and a payment.** *[Topic 4 · Exercise]*
   A payment is the transfer of money or value from a payer to a payee. A transaction is the complete agreement between a buyer and a seller to exchange goods or services for money.
2. **Write the names of tools and techniques used in digital marketing.** *[Topic 5 · Exercise]*
   Social media marketing, SEO, email marketing, content marketing, video marketing, web advertising, affiliate advertising, overall personalization, and creating an app.
3. **What role does digital marketing play in today's world?** *[Topic 5 · Exercise]*
   It improves sales and brand image. It reaches many people at a low cost. It also brings customers back through emails and apps.
4. **How does search engine optimization help the business grow?** *[Topic 6 · Exercise]*
   SEO makes a website appear higher in search results. This means more customers see it and visit it. This increases sales and profit.
5. **How does technology promote entrepreneurship?** *[Topic 7 · Exercise]*
   Technology makes it possible for entrepreneurs to start and grow. It gives opportunities, tools, and digital platforms for selling and getting paid.

6. **State the types of digital platforms.** *[Topic 7 · Exercise]*
   Social media platforms (Instagram, YouTube), knowledge platforms (Quora, Reddit), service-oriented platforms (Airbnb), and e-commerce platforms (Alibaba).
7. **How does project management help in developing a business plan?** *[Topic 3 · Exercise]*
   It plans, schedules, reports and tracks the tasks of the plan. It guides the work from start to finish.
8. **What is the use of a business plan?** *[Topic 1 · Exercise]*
   It explains the business strategy and goals, guides the work, helps get money from investors, and acts as a benchmark for performance.
9. **Why is market research important when setting up a business?** *[Topic 1 · Exercise]*
   It tells us about competitors, demand, and supply. This helps us make a good marketing strategy and beat the competition.
10. **Define business plan.** *[Topic 1 · Book concept]*

14. Trade discounts, freebies and awards are __ promotions. *[Topic 2]*

✔ **a) below the line**	b) above the line	c) online	d) value

Mistakes Found in the Book

1. **Answer key swaps B and C for four MCQs.** The book's printed Unit 6 answer key (checked by the task) gives: 1-B, 2-D, 3-C, 4-B, 5-A, 6-C, 7-D, 8-B, 9-C, 10-A. But when we check each MCQ's own options printed on pages 107–108, the correct answers for MCQs 1, 3, 8 and 9 are actually option **C, B, C and B** — not B, C, B and C as the key says. For example, MCQ 1 asks for the word meaning "an essential written document… of a company's future," and option (c) on that page is "Business plan" — the only correct choice — yet the key marks it (b). These notes mark the ✔ on the option that matches the book's own teaching text, which is the one a student should actually pick.
2. **Snapchat's first name is given two different ways in the same paragraph.** On page 103, the book first says Spiegel and Murphy "created Peekaboo, the first version of Snapchat," and then two sentences later calls it "the initial Picaboo app." The app's real first name was **Picaboo**, so "Peekaboo" is a typing mistake by the book.
3. **"Evan William" should be "Evan Williams."** On page 102, the book spells the Twitter co-founder's name as "Evan William" (missing the final "s"). His correct name is Evan Williams.
4. **"Pagoda" should be "Agoda," and "Safari" is wrongly listed as a search platform.** In the "Types of Platform Business Models" chart on page 105, the Booking Aggregators example list prints "Pagoda" — this should be "Agoda" (a real booking website). The Search Platforms box lists "Safari" alongside Google, Bing and Yahoo — but Safari is a web browser, not a search engine, so this is a mistake in the book's own chart.

5. **No “Answer in detail” section in this unit’s Exercise.** Unlike some other units, Unit 6’s Exercise (pages 107–108) has only 10 “Briefly Answer” questions and no separate long-answer section. These notes still answer all 10 of them in full, numbered detail (as Long Questions) and also give them in short form, so nothing from the Exercise is left incomplete.
